All NEW GASTEINER Hard Drive for Atari ST, STFM, STE, MEGA ST, MEGA STE & the formidable FALCON 030.

Award winner for BEST HARDWARE 1993 -STReview

The All NEW GASTEINER Hard Drive has all the following features:

- 1, Auto Booting and Auto **Parking**
- 2, Front On/Off switch
- 3, Power indicator (LED) light
- 4, SCSI icon selector switch
- 5, Sleeve bearing Fan (17CFM)
- 6, Dual SCSI Port
- 7, Internal 5% Tolerance P.S.U. (90-260 VAC)
- 8, Top Quality Formatting and Partitioning Software
- 9, New Compact Case (4.00x4.64x9.00) (HxWxD)
- 10, 12 Months back to base guarantee

A SERIOUSLY BIG DRIVE FOR A SERIOUSLY SMALL PRICE - ST FORMAT GOLD AWARD AUGUST 1994

(1) EXPERIENCE

With over 20 man years experience in the Atari Computer market. Servicing many happy customers (over 10,000) we are the foremost manufacturers of Atari Hard Drives.

(2) DESIGN

Using the latest C.A.D. Technology we consider Power Supply design, Air Flow characteristics and Drive Specifications, combined with innovative manufacturing processes, ensure that we can produce the most reliable products to the highest standards.

(3) TESTING

Following the initial design process all our products are subjected to an in-depth testing procedure including mechanical and electrical tests, while thermal Trials ensure the reliability of any configuration in every possible environment.

New service/centre for most Atari computers. We examine your computer and report back with an xact quotation price for the repair. If the repair rried out the £10 is then deducted from your bill

When ordering by telephone please quote your credit card number followed by the expiry date and also your full name and address. If paying by cheque please make it payable to Gasteiner Technology. correspondence please quote a phone number and also a

COVER FEATURE

TRUE TYPE

For far too long have ST users had to contend with limited fonts on a *GDOS*-based system, or proprietary varieties on specialist programs. Time for a change – and the time is now.

PAGE 16

NVDI 3 and SpeedoGDOS 5 both offer support for TrueType fonts, an industry standard used on the PC and Mac. Thousands of such fonts are available, many within the public domain.

But there are questions: which of the two competing systems do you go for? How well does the current generation of ST software take to the new kids on the block? Are fonts available? Find out by reading our reviews, practical guide and font feature starting on page 16...

ST SOURCE

... the source of all information! This is where you'll find the best tutorials, your opinions, hints 'n' tips and our answers to your questions...

WE PROMISE - AND DELIVER

With just two remaining glossy ST titles in the UK market, it's important for readers to understand the underlying editorial rules for each mag. So let me speak for ST Review.

• We deliver what we promise. On becoming a Europress title, an assurance was given of 13 issues a year. This has been kept to, unlike our competition. We also recently committed ourselves to bringing you special cover promotions in the form of two cover disks whenever possible, an undertaking on which we have not reneged.

- Reviews are never based on anything other than ST software. We never review an Amiga or PC product and attempt to pass it off unlike our competition which has just "reviewed" the Amiga version of the Championship Manager End Of Season Data Disk.
- The bare minimum for one of our reviews is the final software and a proof manual. Articles on unfinished programs are clearly marked as "previews" unlike the competition which carries a "review" of a half-finished version of *H.E.R.O.* in the current issue.
- We only use UK-based reviewers who cover UK versions of products, with the very occasional exception of previews. This is essential as there is no guarantee that, say, a UK version of a German product will exhibit the same features or performance. The competition's recent review of the Janus card was based on the German product by a writer living, and working, in the German market many of the compatibility table programs have no UK version!
- ST Review understands the difference between humour and damaging flippancy. The claim that an ST-based product can "bring aeroplanes down", as in the November issue DeskTopper review, speaks volumes for our competitor.
- ST Review consistently produces a high quality, factually-accurate magazine and while we are far from perfect, any errors are of a genuine nature. Our writers understand the ST market because most of them have been working with STs for many years. A good review in this magazine indicates that you can go out and purchase that product in the safe knowledge that it will deliver what has been written.

With the improved games section, I honestly believe that ST Review is the only ST magazine an enthusiast needs to buy. We'll keep you up to date on all the new products, help you get the best from your machine, keep you interested through our features and provide you with the best cover disk programs, both serious and games.

ST Review has become difficult to find in small newsagents. If you want to ensure that you receive each issue, and find a subscription too costly, then simply place a regular order with any newsagent. If ST Review's standards fall, you can cancel such an order at a month's notice.

Tell me what you think...

V. Termord

Vic Lennard, Editor

The plot continues
- Towers II rolls on
from where its
predecessor left off...

ON HIGH

Following on from the success of *Towers* on the ST, JV Enterprises is putting the finishing touches to *Towers II – Plight Of The Stargazer*, a Falcon-only release. Like its predecessor, *Towers II* is a role-playing game much in the same vein as *Dungeon Master* on the ST and *Wolfenstein 3D* on the Jaguar. It runs in true-colour mode and is compatible with multi-tasking operating systems such as *MultiTOS* (where it runs in a window) and resolution enhancers like *BlowUp030*.

Towers II is more than three times the size of its predecessor and features real time combat scenes, smooth scrolling, 50kHz tracker music and stereo sound effects. It will be available from all good PD libraries and bulletin boards within the next few weeks. Like Towers I, the game as supplied will be the full version, but only a limited amount of progress can be achieved before you need the manual. This is available in the UK at a cost of £19.95

from Goodman International on 01782 335650. Also in stock is the *Towers I* manual for £15.00. *Towers II* requires 2Mb of free memory and 4Mb of hard disk space.

Rooms to move – and the geezer in the red certainly looks a bit

PROFESSIONAL PLUS

zzSoft (01254 386192) has just released version two of its best selling budget-priced DTP package, *Easy Text Pro Vector*. This latest upgrade is fully compatible with both *SpeedoGDOS 5* and its predecessor, *SpeedoGDOS 4*. The inclusion of *Speedo 5* support means that *Easy Text Pro Vector 2* can make use of both TrueType and Postscript Type 1 fonts as used on the PC and Apple Macintosh. *Pro Vector 2* is currently the only Atari-based *SpeedoGDOS*-compatible DTP package available – see page 20 for more details

As a service to *Speedo 5* users, zzSoft is offering three disks of TrueType fonts at a very modest £3 each. Also available are a number of Postscript Type 1 font disks.

In addition to *SpeedoGDOS 5* compatibility, *Pro Vector 2* has also undergone a number of bug fixes and enhancements, the most notable of which is the increase in the number of fonts to 20 per document, subject to available memory. *Easy Text Pro Vector 2* costs £39.95 and runs on any Atari ST, STE, TT or Falcon with 2Mb of memory and a hard drive or 2.5Mb without a hard drive.

Existing Easy Text Pro Vector 1 users can upgrade to the latest version by returning their master disk to zzSoft along with a £5 upgrade fee. If you also want to upgrade from Speedo 4 to Speedo 5 at the same time, the charge is an additional £29.99.

Moving on up – Easy Text Pro Vector 2 is the only DTP package to support Speedo 5 technology.

NEW HOME FOR IDS

n a surprise turn of events, Wright and Hayes Graphics, publishers of the ST Hondbook, ceased trading in mid-October. Four issues of ST Hondbook had been published, with a fifth being due at the time of the collapse. Launching the publication so late in the day, as far as the ST scene was concerned, was a brave move but the publication failed to gain sufficient support from the ST community.

In addition to *ST Hondbook*, Wright and Hayes also set up an independent software company known as IDS and was working on a number of new releases (mostly games) for the ST market. Regrettably, the first title, *H.E.R.O.*, failed to appear in time to bail the company out of its financial troubles.

CONTINUED SUPPORT

The good news for Atari owners is that although *ST Hondbook* has folded, IDS has been taken over as a going concern and most of the planned releases look likely to go ahead unhindered. Andy Fern of AWF PDL has obtained the rights to IDS in lieu of debts incurred by Wright and Hayes. Both IDS and AWF PDL are now part of Midland Software, also owned by Andy. Midland Software has moved into the old Wright and Hayes offices and will continue to use the IDS name for future releases.

When we spoke to Andy Fern, he had high hopes for the future of IDS. *H.E.R.O.* is now available with a reduced price tag of £9.95 and four more releases are scheduled to be out in time for Christmas. The ST version of *Teom* is imminent and expected to be on sale towards the end of this month for £14.95. A Falcon version, which will utilise the machine's improved sound and graphics capabilities, is also being

ST Handbook folds but new software safe...

developed and is expected to be

ready two or three weeks later at a

not dissimilar price. Both versions of

the game feature advertising banners

how to create detailed human bodies

Out now
- check out
our H.E.R.O.
review on
page 54 of
this issue.

Available soon – IDS's next release is the ST version of

Future release – Alien Thing should see the light of day in early 1995.

Still kickin' – ST Handbook may have gone but IDS lives on.

and more complex subjects such as anti-aliasing.

Midland Software has a number of new titles planned for the IDS label in 1995. There will be a follow-up to H.E.R.O. shortly into the New Year and talks are currently underway for the production of a package entitled STOS Advonced Programmers' Guide. This is expected to consist of a book and two disks and will be similar in concept to A Beginner's Guide To STOS BASIC from MT Software, but will be aimed at the user who has progressed beyond this stage. The only bad news is a delay in the release of Sphericol, but talks are going on with Fusion, the programmers, and it is hoped that the game will still appear through IDS at a future date.

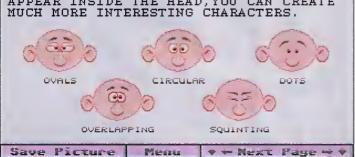

PUBLIC ADVICE

For a small independent company such as IDS to survive, it is imperative that the products it creates are ones that the public actually want to buy. Andy Fern is open to suggestions – especially concerning the viability of the STOS Advonced Progrommers' Guide. For further information on any IDS release, contact Midland Software on 0121-459 4340.

FACIAL FEATURES

(THE EYES)

BY CHANGING THE FACIAL FEATURES THAT APPEAR INSIDE THE HEAD, YOU CAN CREATE MUCH MORE INTERESTING CHARACTERS.

Teach me - Graffix promises to be a rather unique art tutor...

JUST CHAMPION

Domark (0181-780 2224) has just released its *Chompionship Monager* "End of Season Data Disk" for the ST. This allows you to update the *Chompionship Monager* '93 master disk to take account of all the transfers and managerial changes that took place during the 1994 season. In

addition, the latest promotions and relegations have been updated – yep, Crystal Palace are in the Premier Division and Swindon in the first! The End of Season Data Disk is available on its own for £13.99 or bundled with Nick Hornby's best-selling publication, Fever Pitch, for £15.99.

Up to date – Championship Manager '93 can now have all the correct 1994 detaiis...

SOUND 'N' VISION

New versions of Video Supreme and StormTracker...

volume, treble and bass settings on an STe, MegaSTe or TT. You can also

switch the processor speed to 16MHz

if running on a MegaSTe. Several

other small enhancements have also

been incorporated. Existing users

who purchased StormTrocker by mail

order will be contacted directly about

the upgrade. The full StormTrocker 2

package retails at £24.95.

oodman International (01782 335650) continues its support for the ST market with an imminent, major update to Video Supreme. Version 2 of the best-selling video titler incorporates several new modules and a number of other enhancements. One of these is the use of control-coded scrollers that allow you to set up the actions to be followed by your scrolling text using a sequence of predefined commands. In addition to playing sound samples alongside graphic sequences, Video Supreme 2 can now recognise and play 19 different types of soundchip music files such as those used by Mad Max, David Whittaker and many others. Graphical on-line help explains the use of every function, another new addition.

Overscan mode is supported on both the ST and STe, and the Frame Creator module allows you to convert a standard 32,000 byte screen into an overscanned one. These can be packed using the *lce* or *Atomic* packers and are then automatically depacked when loaded. *Video Supreme 2* supports full-screen animated effects and retains file compatibility with version one. A number of new effects for displaying screens have also been added.

The package comes on three disks, requires 1Mb of memory and costs £29.95. Existing users of version 1 can upgrade by returning their master disks to Goodman International along with a £19.95 upgrade fee to obtain *Video Supreme 2* and the new 100-page plus manual.

STORMIN' IN

StormTrocker 2 is the result of feedback from purchasers of the original version and is available as a free upgrade. The new version displays real music notes on-screen, a feature lacking from most other tracker-style programs, and allows you to alter the

Fade to black – Video Supreme 2 includes an overscan option for the ST and STe.

Time to play – the program recognises 19 different types of soundchip music files

FULL FAX

Ladbroke Computing (01772 203166) has recently launched a new Fax Modem for under £150. The new, BT approved, unit is Hayes compatible with both auto answer and auto dial, and comes with a five year warranty. When used as an ordinary modem, it has a top speed of 14,400 baud with support for V.42bls. The fax capabilities are Class 1 and 2 standard and the unit is compatible with Group 3 fax machines, offering send and receive speeds of up to 14,400 baud.

Ladbroke's Fax Modem costs £149.99 and is supplied with appropriate cables for the ST and Falcon. It also includes a copy of Connect, the excellent ST comms package.

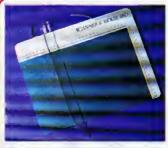

No stamp needed – Ladbroke's new Fax Modem breaks the £150 barrier.

MAT 'N' PAD!

Fancy a cheap scan pad that doubles up as a mouse mat? Golden Image UK (0181-900 9291) has just the item. The 2-in-1 Scanner Pad and Mouse Mat has been designed to perform the same task as a scanning tray but at a much lower cost. It gives you a greater degree of accuracy than scanning by hand alone and includes a transparent cover to hold pictures in place while you scan them. In addition, larger images can be scanned in sections and merged together. Built-in ruler markings allow you to measure the size of the picture and also help you to line up images for scanning in several parts. The Scanner Pad can also be used as a mouse mat, a holder for business cards or anything else you can think of! Available now for £9.95 – and in pride of place in our *Budget Bononza* on page 38.

IN BRIEF

- First Computer Centre has recently set up an Atari-specific file area on its bulletin board. Customers may use the BBS to place orders, download PD software and printer drivers, or ask for specialised technical support. All the usual file and mail areas are also available. The Atari support area is a recent addition and readers are encouraged to upload PD and Shareware files that are likely to be of interest to other users. The BBS runs 24 hours a day, supports speeds up to 14,400 baud and uses the standard 8N1 communications protocol. Call 0113 2 311422.
- Following on from our news item on Virtual Reality headsets in issue 32, VictorMaxx has announced that its CyberMaxx VR unit will be handled in the UK by ICE Distribution. ICE have already put together a developer pack that includes a publication detailing how to adapt your software to take advantage of the headset. Also included is a disk full of examples and free developer support. ICE may be contacted on 01453 756993.
- A record number of visitors attended the UK's only Consumer Electronics Show, Live '94. The six-day event, which covered all aspects of consumer electronics, attracted 182,000 people, significantly up on the previous year. The show, held at Earls Court, was perceived as a great success by all involved and the organisers already claim to have signed up most of this year's exhibitors for next year's event. Live'95 is scheduled to run from September 19 to 24 at Earls Court 1 and 2.
- Heavenly Music and Steinberg are to join forces in a world-wide alliance that will see nine of Heavenly's popular building block programs, such as Dr. Beat and Bytes 'n' Pieces, packaged with Steinberg's products in 45 countries. Quite befitting, as all of Heavenly's products are programmed with Cubase.

Clearly useful – the Scanner Pad includes a transparent cover for seeing through.

INSTALLATION

Before you can try out all the features, you'll have to install Harlekin II properly.

- Use STRBAKUP.TOS to make a copy of the second cover disk and use this
 as your Harlekin work disk. The rest of the installation instructions refer
 only to this back-up.
- Delete all files and folders from the disk apart from the *HARLEKIN.2* folder. Double-click on this and you will find three files, all with a .TOS extender.
- You only require two of these files, depending on the amount of RAM in your computer. If you have a 520 ST with only 0.5Mb of memory, or if memory is generally tight, then delete FULL.TOS: if you have plenty of memory to spare then delete SMALL.TOS.
- Double-click on the *ST Review A* icon again and a second window will open, showing the *HARLEKIN.2* folder. Place the window on the right of the screen. Select the two .TOS files from the left window and copy them over to the right window (see screenshot).
- Delete the *HARLEKIN.2* folder. The disk should now contain the two .TOS files and nothing else. Double-click on *H.TOS* to automatically de-archive it. When extraction is complete, delete the file *H.TOS* and double-click on *FULL.TOS* (or *SMALL.TOS* on a low memory system). Then delete *FULL.TOS* from the disk and reset your system.
- If you own a hard disk, simply copy the full contents of the disk to drive C.

Drag the two files from inside the HARLEKIN.2 folder on the left to outside of it on the right.

JACK OF

arlekin is the ultimate desk accessory for the ST, providing you with every utility you'll ever need. It also includes a control panel to customise system settings and install a replacement system font.

Harlekin consists of 21 integrated modules, ranging from a basic calculator to a text editor and personal organiser. As Harlekin is a desk accessory, all modules are available even within other programs. You can always take a quick look at the personal organiser or even view a

text file, all without having to leave your current program. *Harlekin* also replaces the file selector and adds facilities like a mouse accelerator and a simple screensaver to the system.

GETTING STARTED

Harlekin is accessed from the Desk menu – select it to display the main window. The display consists of several icons, each indicating a Harlekin module, and a click on the curved arrow at the bottom right of

WELL SELECTED

The standard file selector is a great tool, but it does lack some essential features. *Harlekin* installs a replacement file selector that offers much more. You can use it to create folders, check free disk space or search for files. All of these functions are displayed by clicking on the Extra button.

The Paths button displays a pop-up menu where ten preset paths are available. The first six are fixed while the bottom four are automatically updated as you use your ST. This is extremely useful for hard disk owners as the four most recently-used paths are automatically available. These paths can be reconfigured by holding down <Shift> while selecting the path in the pop-up menu. From the small dialogue box, enter the path you want and press <Return>. If you want a path to be updated "on-the-fly" then enter "!" (exclamation mark) instead of a path.

The ten paths are also available from the keyboard by pressing <1> for the first path to <0> for the last one. If you don't want to use the Harlekin file selector, you can disable it from the System Vectors module (see the It's A Set-Up box).

TWENTY-ONE TODAY...

Editor: flexible text editor with formatted printout and full clipboard support.

Manager: the core of Harlekin – a personal organiser that is linked to the other modules.

Terminal: log onto bulletin boards with a modem. There's an automatic dialler and built-in Xmodem and Ymodem transfer protocols.

Monitor: memory and disk viewer/editor, ideal for hacking into the system and recovering files from damaged disks.

Calculator: simple calculator with support for Hexadecimal and Binary formats

ASCII: ASCII table that is linked to the Macro module, allowing input of the full character set in all other modules.

Panel: replacement control panel for setting the system configuration including mouse acceleration and keyboard response.

File Util: powerful file management utility for copying, moving and deleting files.

Disk Tools: format and copy disks using various standard or extended formatting schemes.

RAM Disk: reset-proof RAMdisk module that can be installed and removed at any time.

Filter: printer utility that is used to translate and remap the printer character set.

Printer: printer configuration panel with built-in spooler.

RS232: serial port control panel – sets baud rates and other figures.

Alarm: corner clock and alarm module. The Manager uses this to announce appointments and other events in the personal organiser.

Macro: keyboard macro editor – call up *Harlekin* modules via keyboard shortcuts or auto-enter a sequence of words into the editor.

Convert: Harlekin 1 users can update their old Manager files for use with version 2.

HPG Edit: allows C and Assembler programmers to create their own *Harlekin* modules.

Language: select the language Harlekin uses.

Memory: check how much memory each *Harlekin* module is currently using.

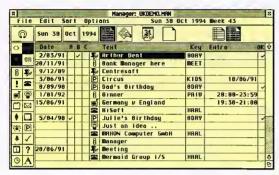

Sorting: allows you to change the way *Harlekin* sorts data in the file selector and the Manager modules.

Vectors: adjusts how *Harlekin* "hooks" into the system. Use it to remove or install the various modules.

ALL TRADES

Another ST Review exclusive – HiSoft's feature-packed Harlekin II...

The Manager module is a powerful personal organi-ser and scrapbook that stands at the centre of Harlekin. Read all about it in next month's tutorial...

the window shows the remaining ones. *Harlekin* installs a mouse accelerator by default, along with a corner clock, a screensaver and a system font, although these settings can be changed by clicking once on the control panel icon title, **PANEL**.

The System Settings dialogue box replaces the standard Atari Control or XControl panels. The keyboard and mouse response can be set: the mouse accelerator has three settings which are self-explanatory, apart from Exp which varies the acceleration according to your mouse actions. Move the mouse very slowly

and no acceleration is used; move it faster and the acceleration increases progressively. Try all three and see which you prefer by clicking on each button and moving the mouse.

The icons at the bottom enable and disable the system beep, keyboard, colour palette, Blitter and screensaver (from left to right). When you are happy with your settings, click on the "close" button at the top left corner of the box. Most Harlekin dialogue boxes are closed this way.

To save the new settings, click on

IT'S A SET-UP

Some of *Harlekin's* features can be switched off using the **Vectors** module. This is on the second modules page so click on the curved arrow to find it.

On the left side of the Vectors dialogue box are the various modules that you can switch on or off by clicking the buttons. Macro allows you to call *Harlekin* modules from the keyboard. For example, <Alternate><Shift><I> opens the main *Harlekin* window while <Alternate><Shift><C> opens the calculator.

The corner clock and alarm module can be disabled as well as the screensaver and alternative file selector. You can also remove the replacement system font and disable the mouse accelerator.

There are two screen modes: Direct and VDI. Direct is faster and should be used if you don't have a screen accelerator such as *NVDI* installed.

the paper clip icon at the bottom of the window. Click on Save DEF file in the dialogue box and the *Harlekin* file selector will appear. Click on "OK" to confirm the save. Other programs will now use the *Harlekin* file selector as it replaces the standard Atari one. See the *Well Selected* box for more information.

Next month we'll take a close look at the core module of *Harlekin* – the powerful personal organiser known as the Manager...

Two-digit accuracy is on offer in the calculator – ideal for balancing your cheque book!

GET THE FULL PACKAGES!

- The full Harlekin II package with master disk, 150-page manual and product registration card, packed in an attractive, protective box for only £14.95 plus £2 p&p.
- Upgrade to Harlekin III, including an enhanced and restyled 170-page manual, for only £39 plus £2 p&p (RRP: £59.95)

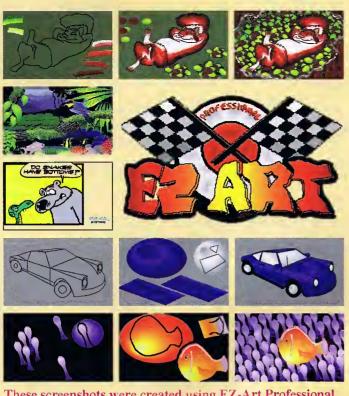

Harlekin III has been completely revised and updated to work with later versions of TOS. It's fully windowed with flying dialogue boxes, coloured icons, MultiTOS-compatibility, high-density floppy support and much more.

Every module has been improved, including the following changes:

- The Editor can now handle four files at once.
- The Manager can sort forwards/backwards and has extremely flexible date entry/display plus external clipboard support.
- The Terminal program has been re-written to work in its own window with a host of extra features.
- There is a separate Alarm handler.
- The Memory handling is far more flexible with all modules taking memory from one central pool.
- You can customise the main *Harlekin III* window to show only the modules with which you wish to work.

These screenshots were created using EZ-Art Professional

EZ-Art Professional is an easy to use drawing package for all ages. In addition to creating your own original artwork using a vast range of custom written tools, digitised colour pictures can be retouched. Comes with an extensive fully illustrated 60 page manual. Here's just a few of its features:-

- * Supports the STE's extended palette, even on an ST(FM)!
- * Over 20 different types of shape are built into the package
- * Over 20 different effects may be applied to blocks
- * Range Editor creates pseudo ray traced effects with shapes
- Supports pictures bigger than the 320x200 screen size
- Extensive file support
- 256 colour pseudo palette available for most operations
- * Irregular blocks may be 'carved' out of your picture

90% rating ST Review August 1994 83% rating ST Format September 1994

EZ-Art Professional normally costs £29.95. Available now at the special low price of £19.95 for a limited period only. Postage free in UK.

Please add £1.50 for Europe (inc Eire) or £3.00 rest of world.

Floppyshop For PD & Shareware

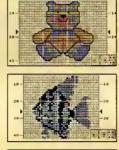

In addition to our commercial software, we also have a vast selection of Public Domain, Shareware and Licenceware for the Atari ST/E and Falcon. Being one of the longest established companies in this field, you can be assured that we only stock the best software and that our service is second to none.

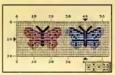

For a free copy of our ST catalogue, send TWO blank disks For a free copy of our Falcon catalogue, send ONE blank disk Please state ST or Falcon when ordering!

Merry Christmas

We would like to thank all our customers for their business throughout the year. Best wishes for Christmas and the New Year. Steve Delaney & Irene Lamb

Casy Stitch

Cross Stitching On Your ST!

Easy Stitch is a cross stitch generator program. Cross stitching is the art of creating pictures and patterns by means of sewing coloured threads onto a fabric base. Easy Stitch is an adaptation of the traditional method of creating the cross stitch design on graph paper. With Easy Stitch, you can design your own patterns on screen in a way that is simply not possible using the traditional method. Blocks of the pattern may be selected for copying, rotating, reversing, enlarging or reducing, thus saving many long hours performing repetitive actions.

Easy Stitch allows pictures created by popular art packages to be used as the basis for your pattern. In addition, the program allows for the use of the more complicated back stitches and half stitches, something lacking in many other cross stitch programs. All popular printers are supported.

Easy Stitch costs only £19.95.

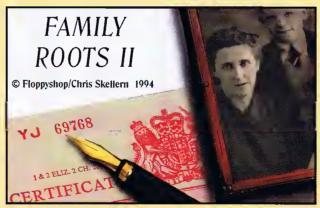

Postage free in UK.

Please add £1.50 for Europe (inc Eire), or £3.00 for Rest

Floppyshop's award winning EZ-Art Professional is the ideal companion to Easy Stitch. Its powerful tools allow you to create stunning designs which may be imported into Easy Stitch and used as the basis of your cross stitch patterns.

How's This For A Bargain?

Buy EZ-Art Professional AND Easy Stitch together for only £35, a saving of almost £15 on the usual combined RRP of £49.90. Postage free in UK. Please add £3.00 for Europe (inc Eire) or £6.00 rest of world.

Family Roots II Trace Your Blood Line with The Leading Genealogical Software

Family Roots is a program designed to assist those of us who indulge in the pursuit of tracing our ancestry or 'family tree'. Unlike similar products, Family Roots is not merely a customised database. It lets the user link each individual into the family tree graphically on the workscreen, whilst allowing easy access to its integrated database. Family Roots II is out now at a cost of £29.95 and comes complete with fully illustrated manual. Postage free in UK, add £1.50 for Europe (incl Eire), or £3.00 for rest of world. Existing users of Family Roots I should contact us for details of how to upgrade.

Oftoppyshop PO Box 273, Aberdeen, AB9 8SJ.

SMF Player – a desk accessory that can play MIDI Files!

SMF PLAYER

Freeware • P. Bogner • All Res.

Play your MIDI Files...

This is a stand-alone program or desk accessory – simply change the extender from .PRG to .ACC. It's designed to play Standard MIDI Files using the ST or Falcon's built-in MIDI port and an external sound module. To get started, try playing the *twiddly•beots* demo from the cover disk.

Click on the Open SMF (standard MIDI file) button, select *BEATDEMO.MID* from the file selector and then click on the **Play SMF** button to hear the MIDI File.

MusiCalc – a useful tool for the modern musician...

PRINTER UTILITIES

BJ300 CONTROL

Freeware • S. Munslow • High/Med Res.

Control your Canon BJ300...

BJ300 CONTROL is a straight-forward utility that can send control codes to the BJ300, switching fonts, print modes and other handy functions. To install, copy BJ300.ACC and BJ300.RSC to your boot disk and reset the system.

FRED WEST

All Res.

Speed up your printing...

Freeware • G. Rutt •

This handy system patch was written by our very own Graeme Rutt and works like a dream. By replacing some slow TOS printing routines, *Fred West* can dramatically reduce print times with high resolution printers such as the DeskJet, especially when used with programs like *Colligrapher* or *TimeWorks*. Copy it over to the Auto folder on your boot disk and reset to install. There die no set-up options to worry about!

PERFSKIP

Freeware • All Res.

DeskJet perforation utility...

If you own a DeskJet printer, you may find this tiny desk accessory useful. It simply enables and disables perforation skip – copy it over to the root directory of your boot drive and reset.

HELPFUL HORRACE

Shareware • C. Skellern • High/Med Res.

Control your text print out...

Helpful Horroce can print out any text file in multiple columns, adding page numbers and many more useful features. The program also allows you to determine the control codes sent to the printer for maximum control. To learn more about Helpful Horroce run it from the desktop and click on the Info button. This displays several help pages which you can print out as well.

Helpful Horrace – print out all those "read.me" files, saving ink and paper.

4/4/2/0/14

Despite our two main cover disk programs, we've packed in 15 utilities as well...

2-Pass Octree OFF

SPEED OF LIGHT 3.5

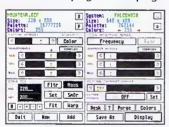

Shareware • S. Denman • 16 colours minimum.

Speed Of Light is one of the best colour image viewers around. Using some clever hardware tricks, it can display 256 colour and true-colour images on a 16-colour display - this means ST low resolution!

Run Speed Of Light from the desktop to get started. You'll be greeted by a copyright notice that disappears with a single mouse click. Next, the registration dialogue box comes up - click on "Cancel" which brings up the main Speed Of Light window. Click on Add to load an image from the cover disk. This takes a few seconds after which you can click on the Display button to see it.

While the image is displayed, you can access a large number of viewing options by clicking and holding down the left mouse button. Features like zoom in and out, inversion and more are available from this pop-up menu. Click the right mouse button to return to the main dialogue box. There is much

more to Speed Of Light. The Histogram facility is likely to be of interest to some users - click on the "H" button at the top of the dialogue box. It is recommended that you read the included manual if you want to get the best out of the program. This program has many clever features that also

allow you to manipulate images in a variety of ways, and is actively supported by the author. So if you are impressed with Speed Of Light, don't forget to register it to ensure the program's continued support.

The main dialogue box. From here you can load, display, transform and save images.

HARD DISK UTILITIES ALIBI

Freeware • C. Bartholme • All Res.

An end to hard disk chaos...

Alibi is a clever program that allows you to place all your programs in one folder using aliases. It works by creating small program loaders that only take up 656 bytes of disk space. Run the program, select English as the language and create an alias for a program by selecting it from the file selector. Alibi then prompts you for a location of the alias. It's best to create a folder where you can place all the aliases. A double-click on the alias then loads the program.

RECOVERABLE TRASHCAN Shareware • S. Hughey • All Res.

Recover trash from TOS 2.06...

Place RT.PRG, RT_M.RSC and RT_H.RSC on the root directory of drive C. Drag the RT.PRG file onto the desktop and use Install Application... under the Options menu to set the default directory to Top Window. From this point, use RT.PRG as your trashcan, dragging files to it for deletion. If you wish to recover files or clear the trash, just double-click on the icon.

Trash back bring vour files back from the dead!

GENERAL UTILITIES

ULTIMEM

Public Domain • I. Hussain • All Res.

Limit vour ST's memorv...

Some old games can refuse to work after a memory upgrade. UltiMem is an Auto folder program that fools your ST into thinking it has less memory than

Copy the program into your Auto folder and reboot. You can then select the desired memory configuration from the start-up screen. The program is reset-proof, so switch your ST off and on again to regain your memory.

SILKBOOT 2E

Freeware • M. Slagell • All Res.

STe/MegaSTe boot patch...

This little program has two purposes: it claims to work better than SIMMFIX, allowing a RAM configuration of 2.5Mb on STes and Mega STes, and also disables the boot delay and memory test on the latter.

To install, insert a floppy disk into drive A and run the program. SilkBoot then writes a small executable boot sector – place that floppy in the drive whenever you boot the system.

DM2WORKS

Freeware • R. Hoekstra • High/Med Res.

Convert Data Manager files...

This is a very simple to use program that converts Data Manager files to AtariWorks format - just follow the on-screen instructions.

LOADINF

Public Domain • K. Pedersen • All Res. Load DESKTOP.INF files...

LoadInf gives a TOS 2.06 feature to older versions of TOS, allowing you to load any desktop set-up contained in the DESKTOP.INF at any time. Just run it and select the required .INF file from the file selector.

FOZCI

Postcardware • J. Akhtar • All Res.

A unique indicator...

FozCi is a CapsLock indicator that lights the floppy drive LED whenever the CapsLock key is pressed! To install, copy FOZCI.PRG to your Auto folder and reboot

Any

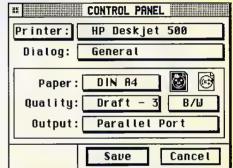

Thousands of industry-standard fonts are now accessible on the ST, but which of the two competing systems is best -NVDI 3 or SpeedoGDOS 5? Ofir Gal cuts through the hype...

DOS was originally intended to allow all programs to use the same fonts and printer drivers, producing a WYSIWYG display on-screen. However, due to the limitations of the original versions, programs like Calamus, PageStream and Calligrapher opted for their own propriety font systems, effectively shutting out Atari owners from the emerging TrueType and PostScript font standards. But the times they are a-changin' - courtesy of NVDI 3 and SpeedoGDOS 5.

SpeedoGDOS was initially released by Atari alongside MultiTOS and the CONTROL PANEL NUDI Font Cache Cache: 4 350 kB FONTPATH J:\DRIVERS\SPEEDO\ FIFPATH J:\DRIVERS\SPEEDO\ Scan Fonts Clear Cache Save Cancel

The key factor that affects the performance of both programs is the size of the font cache. **NVDI 3's Font Cache** CPX can be used to change the size and to add or remove fonts without a reboot.

NVDI's Printer Driver configuration CPX can be used to change the current printer driver useful for switching between draft and letter quality modes.

PERFORMANCE

Measuring the performance of complex systems like these is almost impossible. The speed varies depending on the font cache size, whether the fonts are Speedo or TrueType, the speed of the hard disk and various other factors. In order to produce some indication of the speed, a simple test program was written that attempts to neutralise these factors.

The program performed several tests including the display of fonts at small and large sizes, and drawing bézier curves which are used in art programs such as Kandinsky. The tests clearly show that NVDI 3 excels when displaying larger fonts, but otherwise performance is similar. All timings are in seconds.

Test	NVDI 3	SpeedoGDOS 5	SpeedoGDOS 5/NVDI 2.5
Small text	62	66	65
Large text	27	63	` 60
Bézier curves	57	70	57

Both SpeedoGDOS 5 and NVDI 3 work very well but the latter has the edge when it comes to speed. In general, TrueType fonts are slower in use than the Speedo variety, but the difference with NVDI 3 is less noticeable and the display speed of body text is slightly faster. NVDI 3's speed difference is clearly visible when displaying large point size fonts or .GEM files in programs like Papyrus and Kandinsky. NVDI 3 is also a little faster than SpeedoGDOS 5 when displaying TrueType fonts.

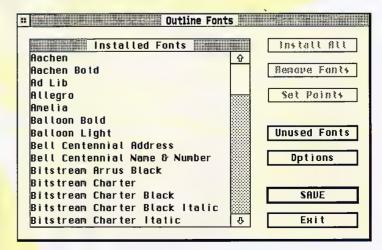

Printing with NVDI 3 is faster with most modern printers. Thanks to data compression, print times are greatly reduced if your printer supports this method of transferring data.

Test	NVDI 3	SpeedoGDOS 5
STraight FAX!	90	108
Papyrus	58	82
AtariWorks	50	78

Times are in seconds for printing a single page in letter quality on a Desklet 500 with Fred West, the printer accelerator on this month's cover disk, installed. The DeskJet supports data compression.

Falcon. Based around GDOS, it boasted added support for scalable Bitstream Speedo fonts allowing GDOS applications to access them. Unfortunately, Speedo fonts are expensive in comparison with their TrueType cousins. Compo recently took over the development, added TrueType and PostScript font support along with colour printer drivers and some speed improvements - enter

SpeedoGDOS 5. NVDI, the ultimate screen accelerator for the Atari computer range, has always had its own version of GDOS built-in, but the technology only supported bitmapped fonts. Now NVDI 3 also offers TrueType support with what is claimed to be a faster and more powerful system that SpeedoGDOS. Are the claims valid? We put both programs to the test.

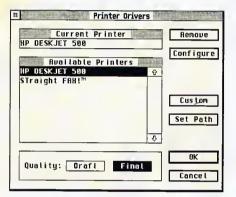

SpeedoGDOS fonts are installed via the Outline desk accessory. This utility is also used to adjust the cache size and set the paths for the various fonts and drivers.

FLY BY LIGHT

NVDI is better known as the market-leading screen accelerator. It works by replacing inefficient TOS screen display routines with highly optimised code, resulting in a phenomenal increase in the display speed of text and graphics.

NVDI completely replaces the VDI part of GEM which is responsible for almost everything you see on your computer screen. NVDI has always included an optimised version of GDOS, allowing the use of fixed size bit-mapped fonts, and is partly responsible for the revival of GDOS-based applications, especially in Germany. The new version simply extends this to scalable Speedo and TrueType fonts.

The net result is that text and graphics are displayed between three and nine times faster than before – scrolling through documents, displaying images and opening dialogue boxes are all visibly faster, even on the most basic ST set-up.

The Drivers accessory is used to install printer drivers under SpeedoGDOS. Various options such as paper size and print quality can also be set.

INSTALLATION

SpeedoGDOS 5 is installed by copying the various files onto hard disk. The program goes in the Auto folder while the two set-up desk accessories are copied to the root directory of drive C. Folders with the fonts and printer drivers are then copied to any convenient location. The two set-up accessories are used to set the paths for the fonts and drivers along with cache sizes.

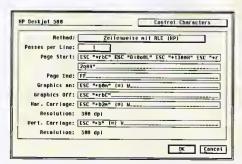

NVDI 3 comes with an installation program: simply select the drive you wish to install to and click on "Install". Also included are five CPX modules for customising the set-up, selecting the printer driver and setting the font caches.

FEATURES

SpeedoGDOS 5 has similar features to its previous incarnation, allowing any correctly-written application to benefit from high-quality scalable fonts, alongside the old GDOS variety. SpeedoGDOS 5 supports the three main font formats: Bitstream Speedo, TrueType and PostScript Type 1.

The package possesses a large selection of printer drivers, including the latest Hewlett-Packard laser and colour DeskJets. The program also benefits if you have *NVDI 2.5* installed, diverting some screen display routines for greater speed. Also on offer is a selection of eight Speedo fonts.

The system is supplied with two

NVDI 3 comes with a printer driver creator – existing drivers can be modified and new ones created.

Papyrus
supports both
SpeedoGDOS
and NVDI 3

letters.

desk accessories that can also run as stand-alone programs. The first installs the printer drivers and allows you to configure the paper size and print resolution while the second installs or removes fonts as well as setting the font cache size – somewhat of a black art that requires quite a bit of experimentation if you are short of memory.

NVDI 3 takes a completely new approach and, as a result, is much faster and requires less memory to run. It supports both Speedo and TrueType fonts and is supplied with a collection of eight of the former. Since NVDI 3 is a complete re-write of the print and display routines, the authors have been able to reduce both size and memory requirement of printer drivers from a typical 60Kb down to just 10Kb.

The package includes a number of CPX modules, two of which are dedicated to the font engine part of NVDI 3. The Font Cache CPX is used to change the font cache size and font paths. You can also install additional fonts without the need for a reset. The second CPX gives you control over the printer drivers and can switch between letter and draft modes or even change printer resolution. NVDI has a built-in IMG driver that creates colour or monochrome .IMG files at any resolution between 72 and 2,540 dpi! It can also output to the serial port if you ever need to.

If you can't find a suitable driver for your printer, *NVDI* comes with a simple utility that lets you create your own. This is simpler than it sounds as you usually start with an existing driver and modify it. Uniquely, *NVDI* 3

drivers support data compression which greatly improves print time on printers that support it such as the Epson Stylus and later Hewlett-Packard models.

VERDICT

While SpeedoGDOS 5 works very well, it is very difficult to recommend it unless PostScript font support is crucial. NVDI 3 provides a much faster solution, uses less memory and is more configurable.

As SpeedoGDOS 5 is closer in design to GDOS, compatibility problems are less likely than with NVDI 3 but, in reality, both systems appear to be compatible with programs that support GDOS. Considering the added bonus of the screen acceleration, NVDI 3 comes out a clear winner on almost every consideration.

SUMMARY

NDVI 3: A tast and reliable font system Includes the industry-standard

screen accelerator
User-configurable printer drivers

SpeedoGDOS 5: A direct continuation of the

GOOS system

Supports PostScript Type 1 tonts
Generally slower than the opposition

FINAL WORD:

"While SpeedoGDOS 5 exhibits satisfactory performance, NVDI 3 is without a doubt superior in almost every way."

MagiC

"If you want à multitasking system that works simply and realiably, then MagiC is for you."

ST Review, June 1994.

MagiC is a full TOS replacement; a very fast disk filing system; has accelerated serial, midi and printing routines; and is, of course, a true preemptive multitasking system. MagiC Desk, a replacement Desktop and a powerful command shell are included. MagiC runs on all ST, Mega and TT computers with 512Kb, but 2Mb is recommended for a useful working system.

The Falcon version is expected later this year.

"It's like running an accelerator and getting the multitasking thrown in for free." ST User, February 1994

he amount of progress that font systems have made on the ST over the past two years is staggering. SpeedoGDOS from Atari sparked a minor revolution in software terms and with the help of applications like Popyrus and AtoriWorks, the ST can hold its head high alongside the Macintosh and PC.

As fast as Bitstream Speedo fonts are though, they're simply not as popular or plentiful as the TrueType and PostScript alternatives used on other machines. SpeedoGDOS 5 and NVDI 3 put an end to the torture of limited typefaces – both allow you to use industry-standard fonts from within your favourite GDOS applications. However, the success of any font system rests on its compatibility, so let's take a look at how the new kids on the block cope with the software packages we all know and love.

BIG GUNS

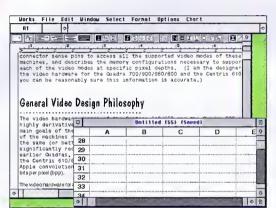

Popyrus is one of the most impressive pieces of software ever to grace the ST and it's a program that relies quite heavily on GDOS. Both of the new font systems cope admirably well and Speedo, TrueType and PostScript fonts (in the case of SpeedoGDOS 5) can be mixed easily on screen. There's a swift burst of disk activity as different typefaces are selected, but with sufficiently large caches – and some form of screen accelerator – installed, the updates are lively.

In common with its predecessor, SpeedoGDOS 5 allows Bitstream fonts to be installed and removed as and when you need them, but the system needs to be rebooted when it comes to TrueTypes. NVDI is a little more flexible in this regard, allowing new fonts to be added at will. The Popyrus "Read Me" file does warn of

TRUE TO FORM

SpeedoGDOS 5 and NVDI 3 promise fonts galore at bargain prices, but how well do they cope with current applications?

Nial Grimes investigates...

AtariWorks
performs
faultlessly
under NVDI 3
and the black
page bug
should be
remedied in the
next release of
SpeedoGDOS 5.

work in either case, but the fact that the documents print at all is testament to the compatibility of the new 600dpi printer drivers.

SPANNER IN THE WORKS!

AtariWorks is also popular among the ST fraternity and makes very good use of both programs. Once again, there are no serious on-screen compatibility problems to report - all of the different font varieties pop up as expected - but when it comes to print time you might face some problems. Put simply, all output to certain printers via SpeedoGDOS 5 is totally black - a huge waste of toner! This is a known AtoriWorks bug, but Compo promises that the next version will include a work-around. NVDI 3 must have the necessary code in place already, because it manages to print without any hassle whatsoever. Another thing you do have

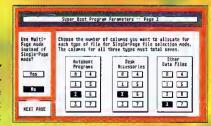

problems should you try to use too many fonts under *SpeedoGDOS 5*, but a bug-fixed version of the latter has since been released.

It's output that separates the men from the boys and in this department NVDI 3 slips into the lead. Background printing works perfectly in both cases, but you get the results a little quicker courtesy of NVDI 3. To give you some idea, the two-page "read me" document printed at 600dpi takes four minutes on a Falcon under NVDI 3, with SpeedoGDOS's output dashing through the door just over thirty seconds later. For some reason, the "light" text style doesn't seem to

Step by step guide

SUPER DOOPER!

NVDI 3 and Easy Text Pro Vector 2 – a marriage made in heaven! But only if you don't mind limiting the number of fonts. Superboot makes this chore one whole lot easier...

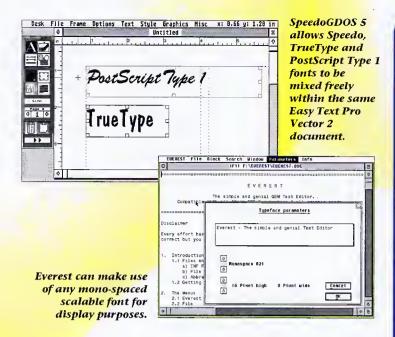

The first step is to make some space for fonts on Superboot's selection screen, so load up the Construction Set and enter the "Program configuration" section. On the third page, increase the "Other data files" setting to three columns. Save the state of play and return to the main menu.

Next, choose the "Configure other file selections" button and add entries for "TT Fonts" (.TTF files) and "Speedo" (.SPD files). Both are type 1 entries, because more than one file can be selected at once. The paths may differ slightly on your system, but the above grab should give you a basic idea.

Reboot the ST and you will be able to deselect fonts by simply prodding the space bar. Your standard range of set-ups can be tagged to function keys, so removing large amounts of manual labour.

to watch out for when using SpeedaGDOS 5 is font names. For some reason it doesn't get on with filenames containing too many underline characters and can simply ignore these fonts. The solution is just to choose a more straight-forward name.

PROS AND CONS

Font systems as powerful as these are begging to be used in a desktop publisher and Easy Text Pra Vector 2 fits the bill nicely. Version 2 is more of a compatibility fix than anything and you can now use all of those juicy TrueType fonts without any complications, or at least that's the theory. Unfortunately, there's still a limitation on the number of typefaces that can be installed and this can be a bit of problem when using NVDI 3, which lacks an easy way of disabling fonts. By using a boot manager, you

The final step is to give the Speedo fonts some proper filenames (let's face it – BX000003 doesn't tell you a lot). The full title is found in the first few bytes of the file and can be uncovered with any binary editor. The desktop must now be used to change the filenames – for example, BX000003 becomes SWISS.

can sort this problem out and the exact method is given in the walk-through on these pages.

Aside from this minor inconvenience, everything works swimmingly well. TrueType fonts do take a little longer to render than the Bitstream alternatives, but that's the case in all applications. 600dpi printers aren't supported, but it's not a major problem considering the level of the package. As long as you make sure the right set of fonts is loaded, all of your older documents can be used and the upgrade only costs a fiver, which shouldn't add to the burden of buying NVDI 3 or SpeedaGDOS 5 too much.

REMAINS OF THE DAY...

Of course, we've only covered the main Speedo-compatible packages here – there are dozens more that can use scalable fonts on-screen and others that can exploit printer output too. Edith Prafessianal is an ideal example and looks a lot more classy using Monospace 821 than the dull old system font. As for printed output, give Idealist a whirl under NVDI 3 – the output will blow you away! Even some older applications, such as WordFlair 2 are willing to make an effort.

Of course, the big question is: "do I need to upgrade to NVDI 3 or SpeedoGDOS 5?" Well, if you want access to the vast majority of fonts on the market, the answer has to be a

KANDI COME HOME

Plenty of public domain and shareware programs also make good use of GDOS, and even these show a reasonable degree of compatibility with the new systems. Kandinsky is happy to display and print any variety of font you happen to have installed and Everest can also use non-proportional fonts for display. Mind you, there have been some reports of problems with the SpeedoGDOS 5/Kandinsky combination, so be sure to confirm compatibility before ordering.

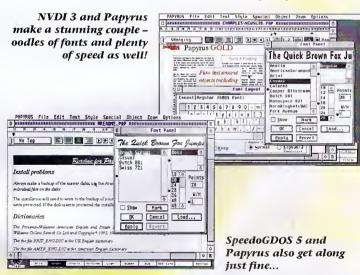

There are also a whole host of other smaller utilities that you can brighten up with scalable fonts too – LHarc and Rufus, for example. As you'd expect, there are some programs that simply don't want to know but as a loose rule, most things that work under the original SpeedoGDOS probably won't object to either of the two newcomers.

Shareware packages such as Kandinsky revel in the new-found typefaces provided by NVDI or SpeedoGDOS.

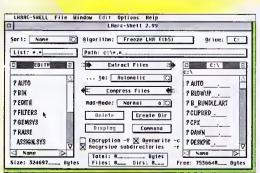

resounding yes! Suddenly, GDOS applications inherit the flexibility usually associated with Calamus and the compatibility level with major applications is surprisingly good.

NVDI 3 does have the edge in terms of stability and compatibility, but both systems offer you a whole new world of fonts for less than the price of a couple of good games...

File Edit Format

Most clean GDOS applications will work with both Speedo 5 and NVDI 3, Wordflair 2 included.

Many public domain utilities, including LHarc, benefit from the addition of a proper font system.

FONTS 'A US

he demand for good quality fonts for Atari programs has gone through the roof in the last year or so but the good news is that the cost of commercial typefaces has dropped considerably. With some careful shopping around, you can pick up more fonts than you'll ever need and all for less than you'd think! Compo Software has been first off the mark with a number of exciting new font packs for *Thot's Write 3*, *SpeedoGDOS 5* and the forthcoming *NVDI 3*.

SPEEDOGDOS GOLD PACK

First out of the bag comes a handy collection of 100 Bitstream Speedoformat fonts in 45 different typeface families. The collection is supplied as 12 disks, shrink-wrapped in plastic, with a thin piece of card listing all the included fonts. There is also a text file on the first disk with a list of which font is on which disk and another easing you into installations for both SpeedoGDOS and Thot's Write 3. If you're using other non-Compo programs, you'll have to work things out for yourself.

The fonts take up 11 of the double-density disks with the twelfth containing a nice bonus: *Studio Convert*, the highly under-rated image conversion utility that usually retails at £9.99. The fonts are present as files with the usual .SPD and .TDF extenders, but there are also readymade .PF files for *Ihot's Write* users which makes installation a lot easier.

The Gold pack consists mainly of display and script-style fonts, making it less useful for certain tasks like newsletters as there are very few good headline fonts but it is a great Andrew Wright takes a look at some mouth-watering font bundles from Compo Software...

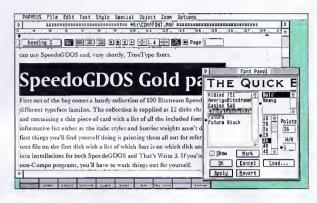

choice if you want to design more exotic pages. However, the inclusion of some good serif body text fonts makes it useful for those wanting to produce reports, letters and other business-oriented documents.

When designing documents it is important to have a wide variety of typefaces from a single family so that headings, captions and body text don't clash. The Gold collection includes good selections of Cooper (from Light to Black Italic Headline), Goudy Old Style and Bitstream's version of Optima. The one oddity is the inclusion of two very similar versions of Bodoni.

SPEEDOGDOS OFFICE PACK

The Office pack consists of a completely different set of fonts, again a hundred in number, but this time split over just nine disks and a tenth with *Studio Convert*. The accent here is on formal and newsletter-style documents with fewer flippant display and script-style fonts.

Highlights include no less than 17 different typefaces in the Futura family and some stylish serif body text fonts. The latter include three variants on the classic face Caslon and Bitstream equivalents of two other well-respected types: Plantin and Bembo. There is also a good 11-strong set of Humanist 521 (better known as Gill Sans) and some trendier, but no less useful, fonts like Bernhard Modern and Copperplate Gothic. The big problem with

Fonts from the Office pack being used with Papyrus.

Bitstream fonts is that the files are numbered and not named but, as with the Gold pack, there is a text file on the first disk that matches the file number with the name of the font. Full marks to Compo for adding this.

For starters - 40 TrueType fonts.

BITSTREAM TRUETYPE FONT PACK

Thanks to the huge market created by Microsoft Windows, TrueType fonts tend to be much cheaper than the Speedo variety so if you're on a tight budget and plan on using SpeedoGDOS 5 or NVDI 3, take a look at the Bitstream TrueType pack.

This contains a balanced collection of 40 good quality TrueType outlines supplied on three double-density disks. Although both .TTF and .TDF files are included, there are no Atarispecific instructions so it's to be hoped you know how to install them. Unfortunately there's no text file on disk either. The two serif fonts supplied, Revival and Imperial, aren't

widely used for body text but will do the job, and there is a handy slab serif face (Square Slabserif 711) and no less than four good quality sans serif faces to make up for it. Best of the sans serif faces is Geometric 706, a great looking typeface in four useful weights, along with Humanist 777 (Frutiger) but display faces like Incised 901 Nord, Poster Bodoni and Bitstream Oz Handicraft are well worth acquiring.

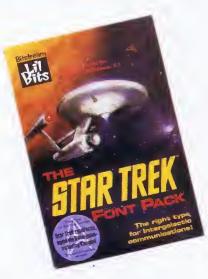

STAR TREK FONT PACK

The Star Trek font pack sounds like a bit of a joke, unless you happen to be a Trekkie, of course. The series might be awash with ham acting and daft plots but the typefaces aren't actually that bad!

Six typefaces are included, ranging from authentic screen title fonts like Star Trek and Star Trek Film to

Serious selection - Gold and Office each offer 100 Speedo fonts.

Star Trekkin' across the milky page...

Starfleet Bold Extended (used on the outside of the spaceships) and a symbol font with a dozen or so badge symbols and Klingon characters. Also thrown in are Venetian 301 (Centaur), a lovely serif typeface but with only the roman supplied, and Square 721 Condensed, a mediocre, rather inflexible sans serif. As far as informal documents like menus and invitations go, the Star Trek pack is good value for money, especially if the modern look is important and you want to boldy go (split infinitives 'n' all... Ed) where no designer has gone before...

BITSTREAM 500 FONT CD

If ever there was a good reason for buying a CD-ROM drive, this has to be it. No less than five hundred delicious fonts are present on the Bitstream CD in both TrueType and PostScript Type 1 formats. This works out at around 160 typeface families with a good spread of serif and sans serif fonts for serious work and some good display and script fonts. If that wasn't enough, you also get the cheering thought that, at 10p each, the fonts are a fifth of the price of those in the Speedo packs and a third of the price of the ones in the TrueType pack. The CD is enclosed in a standard jewel case and is in

All in one – 500 font CD-ROM...

Twelve of the best. In the left hand column, from the top, are University Roman, Bauer Bodoni, Bernhard Modern, Zapf Humanist 601 (Optima), Caslon and Geometric Slabserif 712 (Rockwell).
On the right are Geometric 706, Futura Medium, Copperplate Gothic, Humanist (Gill Sans) Extra Bold, Cooper Black Italic and Incised 901 Nord (Antique Olive).

Not just for Trekkies...

ISO9660 format so it can be read by virtually any CD-ROM drive and driver in use on the Atari platform, including *ExtenDOS* and the *ICD XFS* driver.

The fonts in the collection include almost all of those supplied in the TrueType and Speedo packs, with a single obvious exception in that the Futura family is missing. In terms of body text fonts there is Goudy Old Style, Lapidary 333 (Perpetua), Cheltenham, Bodoni, and various flavours of Garamond, while there are complete families of typefaces like Incised 901, Humanist 521 (Gill Sans), Swiss and Zurich. To make choosing easier, there is also a printed chart with samples of each font.

What else can I say about a collection this big? Most desktop publishers would give their eye teeth for a crack at this lot and I have to say they wouldn't be disappointed. It's a CD worth killing for...

All the products on this page are available from Compo Software on 01487 773582.

Easy Text Professional Vector v2.0 supports TrueType, PostScript and Speedo format fonts through SpeedoGDOS 5 and NVDI 3.

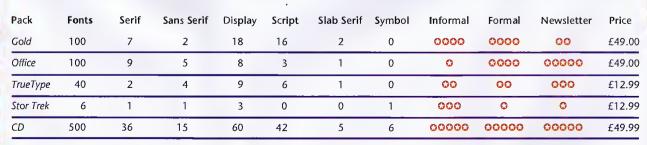

Typeface Family: a collection of related typefaces with the same basic characteristics. The Gill Sans family, for instance, comprises 15 individual typefaces ranging from Gill Sans Light to Gill Sans Bold Extra Condensed.

Font: strictly speaking, the term font refers to a typeface at a particular size, such as 16-point Gill Sans Bold, but in modern usage it can be interchangeable with the word typeface.

THE WHOLE STORY

Need to know how many of each kind of font are available at a glance? Then check out our guide...

The Fonts column shows the total number of fonts in the pack. The columns headed Serif, Sans Serif, Display, Script, Slab Serif and Symbol show the number of typeface families falling into each category. For a fuller description, see this month's *True to Type* on page 83. Symbol fonts include clip art or symbolic characters rather than alphanumeric ones.

The next three columns are marks out of five denoting the suitability of the pack for use in three different types of document. Informal documents are design-intensive ones like cards, menus and ads while formal ones are mainly for business or education – reports, theses and letters. Newsletters get a category of their own because they need a good cross-section of serif and sans serif fonts

All you need is a little market pressure...

TOP MARK

he German Atari scene is getting busy. Last month the Atari dealers, clubs and the German magazine ST-Computer asked their customers, members and readers to send a pre-printed postcard to WDR3, a German TV station that can be seen via the German cable TV network or the Astra satellite. This has a show, WDR Computerdub, and the postcard asked for the presenters to concentrate more on Atari computers. After a couple of thousand cards arrived, they offered to dedicate 20 minutes of the show to the Atari Falcon and DSP-based software, So ST-Computer, Compo, Steinberg and a representative from the German Atari dealers were Invited to talk about the Falcon and its typical user. During the program, the Compo voice mail system was demonstrated as was Apex Media, the Faicon-specific

graphics program, which carried out some impressive. fast morphing. Steinberg demonstrated Cubase Audio and explained that the Falcon still has advantages over PC-based hard disk recording systems. For Instance, most PC sound cards only handle 44.1kHz recording rather than the 48kHz needed for DAT. Also, even the fastest PCs have problems with data transfer to the hard disk while recording. Atari-compatible machines such as the new Eagle and the Medusa were also mentioned.

I recently had a chance to see a working Eagle with a demonstration from the developer – and most impressive it was too. The Eagle 68040 board is aimost finished and first shipments are expected in early December.

Two more new Atari products will soon be on the market here in Germany: Media-Link and noRemote. Both are infra-red

remote control interfaces. Though developed by two different companies, they use the same software which can be handled easily by any programmer. What is the difference? Media-Link has standard features and can send commands to any TV, VCR, sateilite receiver, stereo, CD, light switch and the like. The interface is connected via the ST's serial port. The noLink Interface has similar facilities but can aiso receive, decode and synthesise any infra-red command.

This means that it can be used to control Atari functions and software via your existing TV remote control! Just think of your CD-ROM/Audio player being remote controlled, or starting programs from the desktop via remote. The noLink uses the MIDI ports and standard MIDI commands – infra-red commands can be embedded into existing MIDI

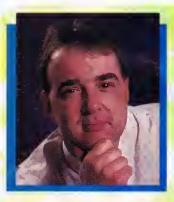

systems. OverScan's Overlay will be one of the first applications to support these new interfaces, allowing you to control a VCR or CD player from a Multi-media presentation.

NVDI 3 is now shipping in Germany and there are even a couple of new products for the ST-Book! Trifoilum is offering 3Mb and 4Mb RAM upgrades, Eickmann Computer has high-power rechargeable batteries while Team Computer is selling external Disk-Drives.

Finally, Catch Computer has announced PowerUp TT, a board that increases the TT's clock rate to 48MHz.

Manfred Bäcker is 27 and works in a Cologne computer shop. He's been programming since 1985 and is active on various bulletin boards in Germany.

Andrew Wright has been writing for the magazine since day one. It's rumoured that he's been car-hunting this month – I wonder what he'ii end up with?

WRIGHT ISSUES

o you know something? I'm tired of hearing storles about Atari users deserting to the PC and jibes about rats leaving sinking ships. To be quite frank, I can't understand what the fuss is about. Of course the modern PC is faster, more powerful and has a wider range of better business software. There's absolutely no point in getting defensive about it. On the other hand, Ataris are simpler to use, easier to live with and much more fun. So what's the problem?

We don't hear storles about
Ford drivers deserting to
Mercedes or Vauxhall drivers
deciding to switch to BMW, do
we? People choose the car they
can afford and the one that does
the job they want it to do.
Metaphorically speaking, your
average PC is equivalent to a
two-litre four-door family saloon
while your average Atari is, I
suppose, a three-door super-mini.

The PC is the business machine, a motorway cruiser that projects the right image for reps and executives. The Atari is the runaround: cheap and economical but quite happy to mix it with the company cars on the motorway if necessary. If you've seen my wife whizzing around in her little 106, and lived to tell the tale, you'll know what I mean (how to start a domestic war – lesson one... Ed).

Quite a few families have two cars – and more often than not they have a big saloon and a runaround. Why shouldn't a computer-loving family do the same? Apart from anything else, the two machines more or less share the same disk format and can share the same printers and even other peripherals like CD-ROM drives. The PC can run those hefty spreadsheets while the Atari runs the fun stuff, the paint programs, the games and the cheap music software. There

If it ain't sinking, don't leave it...

will still be an Atari market in five year's time because of one rarely considered fact - Ataris are unbellevably reliable machines that need very little maintenance and cost next to nothing to repair. As a result there will be a new crop of ST owners around this Christmas who've bought, or been given, second or even third-hand machines. They are a new generation of home computer owner and will get all the help they need from the pages of this magazine.

Some of you will undoubtedly move on to other platforms as their needs change but we have to stop looking furtively over our shoulders. Those turbo-charged PCs with "go faster" stripes will always look nice in the showrooms but, in day-to-day use, they can't do anything more than the little three-door hatchback...

INCREDIBLE POWER

At the centre of the Falcon 030 lie two powerful hearts: the super fast 68030 processor which runs 4 million instructions per second and the Motorola DSP 5601 processor. Working together, they give processing speeds up to 10 times quicker than any other multimedia system at a comparable price. The Falcon 030 also boasts an impressive array of interfaces for linking peripherals.

THE IMPACT OF COLOUR
The Falcon 030 produces images indistinguishable from a real plcture displayed on your TV. Every pixel on screen can be shown in a different colour and 65,536 colours can be displayed at once, from a palette of 262,144, producing a true colour display of the highest quality.

SUPERB VIOEO

SUPERB VIOEO

The Falcon can be used to create special effects, overlay pictures, lighten any that are too dark, even get rid of the unfocussed bits. Video editing and special effect, techniques are both easy and affordable.

CO QUALITY AUDIO
The Falcon 030 comes complete with a stereo input into which can be plugged a microphone, a Walkman, or a hl-fi system. To reproduce the sound, a convertor mixes the eight 16-bit channels, then outputs crystal clear stereo sound at a sampling frequency of up to 50khz, better than CD quality. The Digital Signal Processor with direct-to-disk capability, means that the Falcon can store sound samples, including the human voice, on hard disk and play them back in real time. back in real time.

IN PUBLIC

Danger, Will Robinson!

Nial Grimes is a freelance journalist and ardent biker. He keeps his ST locked in a lead-lined casket and sits a clear twenty feet from the

monitor - just in case!

<mark>wonder whet</mark>her we will be reading warnings like: 'Caution - computers kill!" on the boxes of Falcons, Macs or PCs in years to come? With news of fresh computer-related maladies springing up every other second, things certainly seem to be heading in that direction. There are the obvious problems like repetitive strain Injury (RSI) and the electromagnetic radiation pumped out by monitors, but books like Total Health At The Computer point out dozens of maladies that are (or could be) related to computer use: eye strain, headaches, tension, sore wrists, neck ache, back ache - vou name it! No doubt you have been afflicted by several of these conditions, but are our beloved machines really such a health hazard and if so, what can we do about it?

It seems to me that the whole computer health issue can be squeezed into three categories. The first is ye olde "scare story" and there are plenty of these

around. Most are blown up out of all proportion and given the "plague" treatment by the tabloid press, while others are just down to misinformation—I'm sure we've all been asked whether computer viruses can infect humans at some time or another!

The second slightly more worrying area is the "mystery". The effects of VLF (very low frequency) and ELF (go figure!) radiation on the human body simply aren't known. It's a fact that some types of electromagnetism are very dangerous, while others pose absolutely no health risk whatsoever (radio waves for example). Opinion seems to be divided on where VDUs slot Into this scale.

And the final group contains the bona fide problems – RSI, eye strain and so on. The good news is that almost all of these problems can be avoided by changing your working practice. SImply putting your VDU in front of a window and glancing out every few minutes is said to

relieve blurry vision and eyestrain. Many other problems can be reduced by making sure your computer desk is the right height or that light doesn't reflect from the screen. The fact is that everything is a danger until you learn to use it properly, and the information for using a computer in a safe fashion usually isn't included in the manual, Legislation dictates that computers in the workplace must meet certain specifications, but very few people seem to be aware of safety issues at all!

It's in every computer user's interests to find out how they can work safely with their machine. Most of the serious problems are best tackled before they occur and you'll be surprised at just how simple it can be to improve your working environment. Until manufacturers realise that it's in their interests to tell us how to use their machines safely, we are just going to have to find out for ourselves...

Absolutely MagiC...

he most exciting news
I have heard this month
is that a number of
programmers have teamed
up in Germany to produce
MagiC for the Apple Mac.
Disappointed with Atari's
failure to produce a hi-spec
Falcon, the authors of MagiC
and various others are now
working on a solution. If
Atari can't do it, they will!

Many of you out there have been reluctant to invest in a Falcon so far. There are also many Falcon owners craving for a more powerful system. The only options for a top system are a TT, PAK68/3 board with a graphics card or a Medusa. These solutions are rather expensive.

The TT is equipped with a 68030 processor clocked at 32MHz while the Medusa has the more powerful 68040 double-clocked at 64MHz.

TECH TALK

The faster processor makes the Medusa three times faster than a TT and about five times faster than a Falcon.

The Apple Mac range has developed at a lightning rate and even the bottom of the range LC475 has an 68040 processor running at 25MHz, making it faster than a TT. The Macs have evolved in this way partly due to demand but also because the Mac operating system, unlike TOS or MagiC, simply requires that power.

Surprisingly, the Mac will now become an upgrade path for those of you who wish to continue using your existing ST software. You will immediately benefit from a huge speed increase alongside MagiC's pre-emptive multi-tasking. At the same time, you'll also be able to explore Mac programs and hardware.

An LC475 with 4Mb of RAM, an 80Mb hard disk and a 14" colour monitor will currently set you back just over £800 – and a 15" display will not add much to the final cost. A similarly equipped Falcon costs about the same. The LC475 can display up to 16-bit colour and is at least twice as fast as a Falcon and probably four or five times faster than an ST. The next model up is the Performa 630 which boasts a 68040 double-clocked at 64MHz. A full system with 8Mb of RAM costs £1350, still good value for money compared with a Medusa.

The Mac does lack the audio and DSP capability and there are bound to be various incompatibility problems, especially with older software. Applications like Falcon voice mail or digital audio recording systems will not work, but

most well-behaved GEM programs should. Programs that use the cartridge port will not work either because the Machas no cartridge port! These are factors that will have to be considered by anyone thinking about this upgrade path.

The only question left now is: how long before Mac MagiC appears...

Ofir Gal has been ST Review's technical voice for over two years. He's been heartened to find out that one of the first programs working under Mac MagiC is his GEMBench test program...

3 Steps to Frame Grabbing

1. Capture your picture

2. Convert it

3. Use it

Frame grabbing couldn't be simpler or more satisfying and is probably the best function that you can add to your ATARI.

The ROMBO Vidi ST (12) has been developed to meet this need with the Atari ST, STe and Falcon, offering unequalled performance at a very affordable price. The first digitiser for the ST was launched more than 4 years ago and we have built on a sound research programme to be able to offer the best digitiser for your Atari.

The Vidi ST (12) offers full mono and colour image capturing and mix, animation and processing features. Other major imaging formats such as TIFF, IFF and BMP are supported, making for easy transfer of pictures between different platforms. Supplied with SVHS and composite inputs for connection to your video source.

Major applications include:

- DTP
- Image Scanning and processing
- Computer Art
- Video Editing
- Import and Export between platforms
- Image Database
- Education Presentations
- Animation.

The Vidi ST (12) is available from your authorised reseller or direct from ROMBO.

For more information or to place your order phone 0506 414631 or fax 0506 414634

ROMBO Productions Limited, 2B Young Square, Brucefield Industrial Park, rombo Livingston, Scotland. EH54 9BX.

Good computer animation isn't half as hard as you think. Andrew Wright points the way...

STEP BY STEP GUIDE

ANIMATION ST

Follow our step-by-step guide to see how an animation is created with AniST...

The first step is to place an object on the screen. AniST has literally dozens of animation options, from changing colour to changing

... so in this case we'll define a path for the star to move along. The path is created by simply clicking with the left mouse button.

When the animation is played, the star moves in a loop. Where the path points are close together, the object appears to slow down; if the points are far apart, the speed of movement increases.

ETSANATE

nimation must be one of the most misunderstood computer art forms. The myth still persists that you need to bury yourself in your room for a week just to get a twenty frame animation, but this simply isn't true. Even some older programs like AniST can make light work of simple sequences, whatever your level of artistic skill.

But why bother? Because animation is fun! You can spend an hour or two retouching an image or painting a picture but adding motion makes a big difference. If you want to get a sales point home or simply create a rolling demonstration to advertise

A "frame" is a bitmap image, a number of which make up an animated

sequence. A "sprite" is like an actor in a play: it's a character that moves around the screen and is composed of a bitmap image that is considerably smaller than the background. Sprites are often mini-animations themseives, with their own set movements such as walking or jumping.

"Digitising" is converting iive video into a digitai computer format such as a series of bitmap frames. Speciai hardware is required such as HiSoft's VideoMaster. your services, an animated sequence will leave a lasting impression. Professional animators can command huge salaries especially in corporate presentations, TV and advertising and everybody has to start somewhere!

A 16-colour animation looks much better than a 16-colour image. Most STs can only display 16 colours in low resolution, but as the colours in an animated sequence are changing fairly swiftly, the eye perceives shades in-between that aren't really there.

WAYS AND MEANS

Animation means different things to different programs. The classic art package, Degos Elite, had an animation feature that consisted entirely of cycling colours. It worked well for creating flaming fires and cascading waterfalls but that was about it.

By most definitions, animation is a series of images displayed in rapid sequence to give the appearance of real movement. You have to create a slideshow of carefully drawn images

MovieMaster combines sound and an intuitive interface.

and display them one after the other, or display a fixed background and move a smaller picture, known as a sprite, in front.

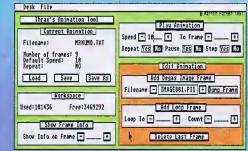

The slideshow method is used by programs like TruePoint in which the images are stored in memory and displayed quickly in sequence. Animtool is a useful shareware program that takes such a series of low resolution images and turns them into a single animation file for distribution among

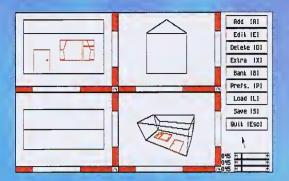

Another good way of generating slideshow sequences is to use a raytracing or morphing program. You could create a series of raytraced images, slightly moving or rotating an object each time. The sequence can then be played as an animation. Most morphing programs, such as Metamorphosis 24, reviewed last month, automatically create such

Using sprites is far more flexible as you can make changes more quickly and even add or remove sprites without having to alter each frame. SpriteMaster and MovieMaster are excellent examples, one being used to create the sprites and the other to arrange them on-screen in the "movie". MovieMaster even supports sound: you can achieve some stunning cartoony sequences without too

Anyone who has seen the film Who Fromed Roger Rabbit will know just how much fun it can be to mix real live characters and cartoons. HiSoft's superb VideoMoster package lets you do just that. All you need is a video camera or player and the VideoMoster

Animtool is ideal for stringing individual frames together into a stand-alone

Polyfilm lets you create quite complex objects and view them in 3-D.

hardware. You can then grab whole sequences of film up to the limit of your machine's memory. Better still, you can edit each digitised frame by exporting them as a 16-colour, 160 by 100 pixel image and loading them into an art program to alter features or superimpose sprites. Another trick is to use a camcorder to film inanimate objects being moved about, grab the sequence in VideoMaster and then remove the frames where your hands are visible.

THE TWEENIES

Computers may have revolutionised animation but many of the basic techniques remain the same. The first cartoons that appeared in the '40s heralded an entertainment technique that has never palled, even with adults. Disney's latest blockbuster, The Lion King, may demonstrate how

animation has improved over the years but Tom and Jerry cartoons are just as popular as they ever were!

Early cartoons were created by filming storyboard sequences composed of individually drawn cartoon pictures. However, even a five minute cartoon might have taken several thousand drawings and would have taken months - if not years - to be produced by one person. To get around this, a team technique of frame by frame animation was developed. The best animators drew the main frames to illustrate the story line and then an army of less skilled artists created the in-between frames, or "tweenies", using the start and end frames as a guide.

In the more sophisticated computer animation programs, the computer takes on the role of the "tweeners" by extrapolating the frames in between those you define. Programs like *AniST* and *DA's Vectar*

There is very little in the way of animation software specifically for the Falcon, with the single exception of *Apex Media*. On the other hand, most ST-developed animation software runs perfectly well in ST-compatible modes, though you're restricted to 16 colours. If you're thinking of putting together a sequence of images, perhaps output from a morphing or ray-tracing program, there's always the option to use 256-colour mode or even true colour.

There's a Falcon-specific version of *VideaMaster* that offers 64 grey scales rather than 16 and which includes a copy of *TruePaint*. There is also a 68030 version of the Brainstorm movie player, *Movie 100*, which displays FLI animations in 256 colours. These FLIs can be sourced from PD libraries or PC CD-ROMs.

use a similar technique, with vector graphics making the process easier.

TRICKS OF THE TRADE

Remember the squash and stretch principle – characters and objects should move and behave like forms that have volume and mass, rather than just being a series of connected lines. For example, a ball changes shape as it hits a wall.

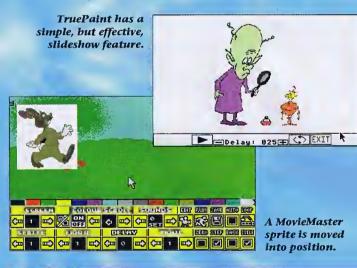

Anticipation is the technique of using preparatory movements to underline actions. For example, a character about to jump will crouch slightly beforehand. Remember to use follow-through too. A running person coming quickly to a halt will bend forward slightly once the feet have stopped, and then recover.

Rather than use straight paths for moving characters or body parts, try using arcs to give a more fluid, realistic motion. When a human walks, fits head inevitably bobs up and down, and this is best represented by using an arc to draw the head in the between frames.

Put some thought into the use of the foreground and background elements and remember that characters or objects moving towards the viewer should grow larger and vice versa. This simple technique of increasing and decreasing size can be used very effectively in animations.

CONTACTS

All shareware/freeware products were supplied by Goodman International (0782 335650). VideaMaster and TruePoint are available from HiSoft (0525 718181).

SOUNDING

Have you ever wanted to give your ST a personality? Nial Grimes steps in with some "sound" advice on brightening up your computing life...

A "sample" is simply a snatch of real world sound in a format that

can be played back by a computer. Samples are stored as digital information in memory and the quality is defined by the "frequency" (or number of "samples" per second). The higher the frequency, the clearer the sample - and the more memory it takes up. STes, TTs and Falcons can play sampled sound without placing any load on the central processor, whereas the poor old ST has to work a little bit harder.

The device needed to turn analogue sounds into digital information is, naturally enough, known as a "sampler". If you really can't make do with the many sounds available in the public domain, a brand new MasterSound cartridge will set you back about £20.

omputer manufacturers are brilliant at designing machines that get the job done, but when it comes to more basic needs, such as giving their creations a personality, they are at a complete loss. Let's face it, priorities are all wrong at the moment – what good is it if you can adjust the colour of the desktop, but can't use a Monty Python

But the public domain plugs this gap nicely, stepping in with dozens of entertaining, but essentially useless, programs to lift your ST out of the depths of anorakdom. Think of it

this way - just as an XR2 is incomplete without a set of fluffy dice hanging from the rear-view mirror, your ST is not being used to its full potential unless it has at least two of the following programs installed...

A GOOD TRACK RECORD

The ST has come a long way in terms of music replay over the last few years and the public domain is crawling with programs specifically designed to play music from the desktop. Most are fronted up by a CD-style control panel and use Soundtracker modules, the quality of which is quite remarkable. The tunes available on these disks range from contemporary classics such as Axel-F to original compositions - look out for DEMONS.MOD by the Red Sector.

Arguably the best tracker player is simply called DeskTracker. On this month's cover disk, it runs as an accessory, works on everything from the humble ST right up to the Falcon and packs a range of features that any top-of-the-range CD player would be proud of. Complete

Awkward to set up, GBell is one of the most entertaining utilities you will ever install on your machine.

The sound sample used by Ping! can be adjusted "on-the-fly" through a neat little CPX module.

Ping! only replaces the system bell, but hey - it's better than nothing, right!

ON THE CHEAP...

THE SOUND MASTER

The Falcon was designed as a sound-oriented machine and as such features a huge selection of entertaining audio utilities. Atari themselves kick off the show right away by bundling the *System Audio Manager (SAM)* in the box. This wonderful utility allows samples to be added to a wide variety of system events in much the same way as GBell, and the supplied sounds are just superb.

If you can't be bothered with SAM, Fortune is a nice, simple alternative. It doesn't replace every single GEM event, but instead concentrates on playing a sound at start-up. It can be instructed to play a specified "cite" every time the machine is switched on or allowed to use its own discretion – much more fun! Once again, a good selection of examples – or should I say samples – are supplied to get you started.

If you own a Falcon, you don't even need to bother with a sound sampler because all of the necessary circuitry is built into the machine. Just plug a microphone into the back, load up Falcon D2D and start recording!

sequences of modules can be programmed into its memory or you can just provide a file path and let DeskTracker play DJ! The Ultimote Trocker is another good example of a music player although it does need a machine with DMA hardware to run.

If you prefer to keep your ST's full attention on the task in hand, Auto folder tunes are worth consideration. These lack the quality of tracker modules, but steal very little precious processor time.

One of the most entertaining aspects of the Apple Macintosh is its ability to attach sampled sounds to various system events. A hideous cackle whenever a nasty dialogue box appears on screen or a "I'll be back" quote whenever a quit button is pressed can do wonders for the "fun rating" of a machine. Of course, the ST is capable of carrying out this simple task with the right software, and the degree of customisation that can be added depends much on the machine you own. For the standard ST, there's a nice little CPX module that sits inside X-Control and replaces the ultra-dull system bell with a

Your Falcon is not complete without a copy of Fortune - there's nothing like a good Blackadder quote to kick off a computing session!

sound sample of your choice. With *Ping!* safely installed, the ST's sign of protest ceases to be an annoyance and actually becomes quite an enjoyable experience.

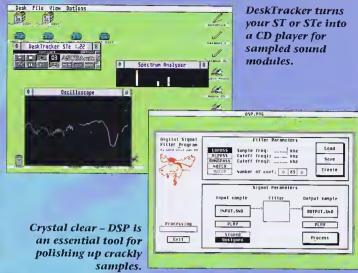

If you've got an STe or a TT, you can lift your machine to an even higher audio dimension. GBell is a little box of tricks that can add sounds to almost any system event, be it sizing a window, cancelling a dialogue box or calling the file selector. It can even watch out for certain window names and play a

The Ultimate Tracker is a good choice for STe owners seeking desktop entertainment...

The Falcon has built-in sampling hardware and the ST can perform similar tricks with the help of MasterSound.

Slock Ead

"hallelujah" sample whenever you open the GAMES folder for instance! The only real problem that GBell puts forward is a seriously bad attitude towards configuration. Instead of providing a nice little customisation accessory, the author expects you to get your fingers all dirty with a text editor. There's also the added problem that Atari didn't follow the rules when they wrote the

Desktop. All of the samples work perfectly from the NewDesk under MultiTOS (by which time Atari had seen the error of their ways) but only applications are affected when it comes to standard TOS. At the end of the day, it's certainly worth persevering with GBell – from the very moment the first Blockodder or Monty Python quote booms forth from the speaker you will be hooked!

GET DIGITALI

The down side of using any sampled sound is that it eats its way through mountains of processor time. The standard ST has no way to play samples under its own hardware steam and as a result the bulk of the

work is left to the central processor – bad news when it comes to speed. The lower the frequency of the sound, the less time the processor has to play it, but the flip side of the coin is a reduction in quality.

DSP is a halfway solution to this problem. It takes any scratchy sample and attempts to remove as much of the noise as possible through software. Unlike the Falcon's hardware DSP, it can't do this "on-the-fly", but it accomplishes much the same task in the long term.

Cleaning up samples is a two-stage process. Firstly you need to create a filter, which takes around a minute, then the sample is loaded and cleaned up. Once a good filter has been developed it can be saved to disk and used again instantly.

DSP can also improve the quality of samples on the STe – after all, the better the sample before it has been sent to a hardware filter, the more impressive it will sound at the end of the day. I know it all sounds horribly complex, but believe me, having persuaded your ST to use sound at every available opportunity, you owe it to yourself to make sure that the samples are as clear as possible.

For ultimate customisation with a friendly front end, you can't beat the System Audio Manager.

THE HACKER CRACKDOWN

Bruce Sterling

The author will be familiar to some of you for his science fiction works, in particular co-author of the excellent *The Difference Engine* and editor of *Mirrorshodes* anthology. This book is a factual study of the hacking community on the electronic communications networks in the US and the crackdown by the various law enforcement agencies in the late '80s.

The book is divided into four parts. Crashing the System takes a historical look at the events in the hacker underground that led to the eventual crackdown. The descriptions of the workings of the telephone system are particularly absorbing. The Digital Underground concentrates on the hackers: the personalities, the culture. Here we get to the truth – the weirdos, the sad, psychologically inadequate teenagers, the thieves, the pimps.

Low ond Order does much the same on the law enforcement agencies. Again, individual personalities are given the third degree but Sterling is defensive and supportive on the whole. The Civil Libertorions traces the emergence of the Electronic Frontier Foundation and other groups worried about the strong arm tactics of the law, the infringement of rights to privacy and freedom of speech. The book ends on a positive and encouraging note.

Other books have tended to be one-sided, dealing with the colour and supposedly "glamorous" world of hackers, leaving a bad taste in the mouth concerning the law enforcement agencies. The content, despite being

founded entirely in the US, cannot be faulted. Sterling's style, however, takes some getting used to, lacking order and restraint, although this is my only criticism of an otherwise excellent read. The text is also available on the *Internet* free.

Paperback (Penguin): £6.99 Hardback (Viking): £16.99 ISBN: 0-670-84900-6

0000

HACK ATTACK!

Mark Baines looks at three books that explore the world of the hackers and their crackers...

APPROACHING ZERO Bryan Clough/Paul Mungo

There is a great deal of similarity between this book and the first half of Sterling's, both released at the same time. However, the parallel ends there.

Clough has a wide experience of computer viruses and security and is a consultant for New Scotland Yard. Mungo is the journalist. As you might expect, this description of hackers and their crimes is more international and includes the Prestel hacks and other UK hacker stories. They have obviously put a lot of research into this book, much of it first-hand, but there are also some glaring errors and misconceptions typical of those with limited experience. For instance, all the dates of the Prestel hack and subsequent court cases don't agree with my comms log notes from the events as they happened and from the parties concerned. The supposed threats of viruses, logic bombs and trojan horses is entirely exaggerated. It's not hard to work out why they take this stance. Computer techies will find errors throughout the book.

Their style isn't romantic - you have no doubt what Clough

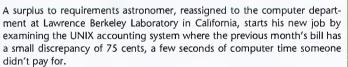

and Mungo think of hackers and their activities – but the book is one-sided. Out of the 230 pages, only 28 deal with law enforcement.

I don't see much point in reading both Sterling's book and this. However, bearing in mind the cheaper price *Approaching Zero* is worth a look.

THE CUCKOO'S EGG

Cliff was a budding software wizard and finding the supposed bug was the ideal task to make Cliff familiar with the networking system and get some experience under his belt. "First-degree robbery, huh?" Cliff responded. "Figure it out, Cliff, ond you'll omoze everyone," Dave said – and little did the department's UNIX guru know how prophetic his words were.

This is the story of how Clifford Stoll tracked down the cause of the missing 75 cents, the hacker behind it (bent on stealing military and scientific secrets) and the frustrations of dealing with authorities that didn't seem to care. It's a detective story of the best kind, fascinating and entirely gripping. Stoll has an uncomplicated, readable style putting the technical aspects over with ease so that even computer illiterate readers will not get

lost in the detail. As a bonus, there is an excellent chocolate cookies recipe!

If you enjoy the frustrated private eye against all the odds genre and are interested in computers, then I'd go so far as to say that this book is a must. I thoroughly enjoyed

"With reduced call rates there's never been a better time to invest in Communications"

To ensure the highest possible reliability, the drives are tested at every stage of assembly by skilled technicians.

All drives are ready to 'Plug in and Go' when you receive them. When you first boot up your hard drive you will find a wealth of Public Domain Utilities which have been selected by our support staff.

All Data Pulse Plus Drives include 12 months warranty and free phone advice and support by genuine Data Pulse Plus users.

The low power consumption of these Autoparking Autobooting mechanisms means that they can operate well within their safe operational temperature ranges without the need for fan cooling. This coupled with the design of the case results in probably the quietest Hard Drive range available for the

IT'S SHOW TIME!

If you're an Atari owner, the only shows worth visiting are the ST Review shows...

WHY?

Because people who visit our shows return time and again – they're the only opportunity for you to meet the top ST companies, see the latest new releases for Atari computers and buy at special show prices. Exhibitors at our shows go to the trouble of demonstrating their products – not just piling them high behind a counter. With four events in the UK before Christmas, these shows are truly nationwide. All venues are conveniently located near to main roads and rail/tube links which means that everyone can attend.

WHAT'S ON SHOW?

While you can buy games at our shows, these are not games shows. They are for the Atari user who does more than just zap aliens! Top companies like Atari Workshop/Systems Solutions, CGS, Compo Software, Titan Designs and 16/32 Systems will be at both of these shows, as well as *ST Review* of course. Now's the time for you to experience an *ST Review* show.

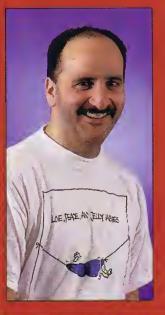

VISITORS MEAN PRIZES

Yes – if you visit the show you could win one of our prize draws. £100 of prize vouchers must be won in our prize draws at each Show. Anyone who attends can win!

FIXING AND FITTING SERVICE

Any hardware you buy from any stand can be fitted to your computer for a small fee at the Compo Software stand. What's more, if you are bringing your ST in for an upgrade or a repair, you get into the show for free!

QUESTIONS 'N' ANSWERS

On a personal level, I'll be at both of these shows so be sure to wander along to the Go Direct stand for a chat. But even better than that, there will be an Open Forum at the London Show on Sunday, December 11, at 2.30 pm where you will be able to throw questions at a panel comprising of myself and various members of the ST Review editorial team. Don't miss this chance to get answers from people in the know...

HOW TO GET THERE

BIRMINGHAM SHOW – NATIONAL MOTORCYCLE MUSEUM (0675 443311), COVENTRY ROAD, BICKENHILL, SOLIHULL, WEST MIDLANDS B92 0EJ. SATURDAY DECEMBER 10, 10AM TO 5PM.

BY ROAD:

- Turn off junction 6 of the M42
- Follow the directions towards Birmingham along the A45.
- The Museum is located on the next roundabout.

BY RAIL

- Go to Birmingham International
- Take the 900 bus (to Coventry) for about a mile.

BY BUS:

Take the 900 bus from Birmingham or Coventry.
 Service runs every 20 minutes.

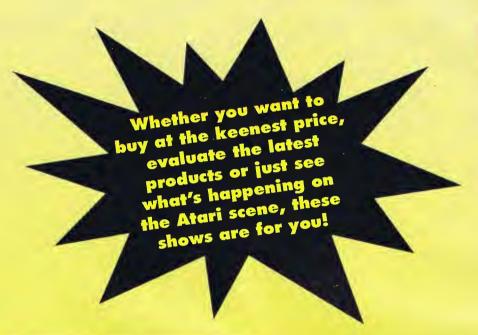

LONDON SHOW – NOVOTEL (081-741 1555), 1 SHORTLANDS, HAMMERSMITH, WEST LONDON W6 8DR. SUNDAY DECEMBER 11, 10AM TO 5PM.

BY RAIL:

 Go to a main London terminal and take either the District, Metropolitan or Piccadilly underground lines to Hammersmith.

BY ROAD:

 Aim for Hammersmith Broadway and follow the signs for Novotel. Integral car park holds 250 cars.

BACK ISSUES

If you've been following a series and missed the last one, or have been looking forward to the next issue but can't find it at the newsagents, you'll know just how disappointing it is to miss out on an issue. Well, never fear!

You'll find various back issues of Atari ST Review and Atari ST User on sale at bargain prices at the show.

Organised by David Encil, Neal O'Nians and Ray Crass

Tickets

- All tickets on the door no advance bookings.
- Tickets cost £5, £3 after 2pm.
- Children under 16 are free when accompanied by an adult.
- Free admission if you bring your computer along for fitting or fixing at the Compo Software stand.

THE LATEST MAGAZINE

Make a bee-line for the Go Direct stand as soon as you walk in the door. You'll be able to pick up the latest issue of Atari ST Review at both of these shows!

Yes – it's ST Review's annual guide to a pocketful of goodies at less than a tenner each...

BUDGET

1 Classic War Games Compo Software

Armodo and Borodino are two of the best war games ever released on the ST and this presentation pack from Compo comprises both. The games are set over a 3-D landscape and £7.99 will buy you this slice of British and French history.

2 STe Upgrade Ladbroke Computing

Just £4.99 will buy a memory upgrade for your struggling 520STe. Fitting is as simple as slotting the two cards into place and a whole world of software opens up the instant you slip the casing back into position.

3 Plonker! Dunce's Cap Software

Plonker! is a rework of the classic Mix 'n' Match concept. It includes five different methods of play, bonus rounds galore and is beautifully presented. Persecute your brain for £9.99!

4 Auto Joystick Switch Golden Image

Putting the joystick ports on the underside of the ST certainly wasn't one of Atari's better ideas, but this gadget completely removes the cable-swapping nightmare.

Switching is automatic – the cost is £9.95.

5 Scanner Pad

Golden Image

Keeping your hand scanner moving in a straight line is a constant struggle, but this T-square and pad

combination from Golden Image makes the job an awful lot easier. What's more, it doubles as a high-quality mouse mat and will set you back the princely sum of £9.95.

6 Tecnoplus Mouse Ladbroke Computing

Let's face it – the original Atari mouse is probably the most useless piece of technology since the ZX81! The vastly superior Tecnoplus rodent features micro-switched buttons and costs a paltry £9.99.

7 Superbase Personal Compo Software

Superbose Personol is the ideal way to keep track of addresses, telephone numbers, and all sorts of other information. It's "relational", meaning that one database can be linked to another – superb value at just £9.99.

8 100 Capacity Disk Box

Ladbroke Computing

Take a look at that huge, wobbly heap of disks over on the corner of your desk and think how much nicer they would look in a smart box. £7.99 is a small price to pay for a safe and tidy disk collection...

9 Backgammon Compo Software

What could be more relaxing than a game of Backgammon? This classic version from Atari runs in both colour or monochrome and is guaranteed to be more entertaining than the Queen's speech – and for just £5.99!

CONTACTS

Our undying gratitude goes to the following companies for supplying the goods on this page:

Compo Software: 01487 773582

Dunce's Cap Software: 01670 850629

Golden Image: 0181 900 9291

Goodman International: 01782 335650

Ladbroke Computing: 01772 203166

System Solutions: 0181 693 1919

zzSoft: 01254 386192

10 DegasArt Goodman International

Brush up your artistic skills with a little help from *DegasArt*. This two-disk set contains some excellent advice on making the most of *Degos Elite* and on the principles of computer art in general – yours for £7.95.

11 Studio Convert

At £9.95, this has to be one of the most useful utilities a DTP fanatic can get his hands on. It takes graphics files in a huge variety of formats and converts them to mono using a screening pattern of your choice.

12 C-Font 2 Compo Software

How many times have you browsed through a PD catalogue, wishing that you could convert *Colomus* fonts for use with *Timeworks* or *Thot's Write?* Well, pick up a copy of *C-Font 2* for just £9.99 and you can!

13 Club Dominoes Goodman International

This game is the be all and end all of domino simulations. It offers lots of styles of play and the manual includes a complete history of the game. Sadly you can't give up and start building houses with the pieces though. At £9.95, it's cheaper than a decent set of dominoes too!

14 Video Supreme

Goodman International

Adding titles to your home videos is a piece of cake with *Video Supreme*. For £9.95 you get the titling software itself plus full instructions on how to hook up your ST to a VCR.

15 Blow-Up 030 Software

System Solutions

Have you ever wished that your Falcon's desktop was larger, or that you could see more of a document in Calamus? In that case you need Blow-Up – the première Falcon VGA screen enhancer. The software-only version will set you back just £9.99.

16 The Monulator Goodman International

Need to run mono programs on your colour system? Then you need *The Monulator*, a minor software miracle that tricks your ST into displaying high resolution on a standard colour display. It offers a number of advantages over public domain alternatives at a cost of just £9.95.

BOMANIZAS CHRISTMAS AND A HAPPY NEW YEAR FROM THE ST REVIEW TEAM

17 Brilliant Boffin **Brothers**

Goodman International

MicroMagic has got this educational software thing down to a tee. Boffin Brothers is a rather neat question and answer game - and at a cost of just £3.95, it's well worth considering for those long afternoons after the Christmas turkey...

18 Introducing Atari ST Machine Code

zzSoft

Assembly language offers unrivalled speed when it comes to programming the ST and this £9.95 book offers a good introduction to the art of battling with your machine at a hardware level.

19 Blank Disks

Goodman International

No matter what you use your ST for, blank disks are an absolutely essential purchase. They can be used to back up cover disks, save game positions or to store valuable data from your word processor. Goodman's disks are made in the UK and the special offer price is just £9.95 for 25!

20 Cover Disk Removal Kit **Boots The Chemist**

It has taken years for ST Review to perfect the industrial strength glue used to weld the cover disk to the front of the magazine. This kit contains a scalpel to hack your way through the tape - and a free box of Band Aid to mop up the blood!

SECOND ANNUAL ATARIST REVIEW AWARDS

The votes are in for the 1994 awards...

elcome to the second set of Atari ST Review award results – grab a cuppa, put your feet up and read! Where necessary, products have been grouped: Timeworks includes Timeworks 1 and 2 while Calamus includes the three different versions. And most of you obviously hate to be negative – the "worst" columns on your entries were generally left unfilled, hence the lack of results here.

Bearing in mind their product ranges, it comes as no surprise to see System Solutions and HiSoft taking four awards each. The former's MiniS hard drive actually polled more votes than any other single item.

Our cover disk offerings have gone down well over the year with GEMView and Everest scooping the Shareware section, while Imagecopy has gone from best cheap 'n' cheerful product last year to winning the Graphics award. Various of this year's newcomers have taken awards, including EZ Art Pro, AtariWorks and Hewlett-Packard's excellent DeskJet 560C. Papyrus has also left its mark, dead-heating with Protext in the Word Processor section.

Frontier Elite II is clearly the game of the year, but
Tempest 2000 came runner-up in the Games section for
Best Sound – and yet it's a Jaguar game!

The greatest no-show was a one-horse race –

Chromastudio 24 won by a street. And as for the poor old

Atari mouse, the less said, the better...

ake a look at that General MIDI sound module sitting next to you. How many megabytes of ROM do you think the sounds take up - 2Mb? 4Mb? And what kind of processing power does it possess? The equivalent of a 68000? Probably. Now take a close look at the Falcon. The standard internal hard disk offers 60Mb or 80Mb of storage and the partnership of the 68030 main processor and 65551 digital signal processor is powerful enough to blow most sound modules away. Four megabytes of memory, built-in MIDI connections, stereo audio outputs... the list lends itself to an audio workstation. Enter TDSM...

MIDI GENERAL

Martin Griffiths may not mean much to the average reader, but "Griff" might. Martin is responsible for the *ProTracker Replay* software, converted *ProTrocker* for the Falcon and has also created some of the Falcon's best demos such as *Things Not To Do*. He's currently working as a researcher into video compression at Kent University, hence his latest Falcon offering, *MPEG Player*.

In conjunction with System Solutions, Martin is working on a project to make the Falcon behave as a General MIDI sound module. The working title of *The Digitol Sound Module*, or *TDSM* for short, may be less than awe-inspiring but the idea certainly is. Essentially, the program offers the front-end screen for the 128 basic General MIDI sounds which are stored on hard disk and accessed as and when required.

The General MIDI specification allows for two possible configurations: 24 voices or eight dedicated drum voices and 16 dynamically allocated for the other instruments. Martin has chosen the latter, and for a very good reason: the eight-channel DMA sound chip handles the drums so reducing the overall load on the main 68030 processor.

The current beta-test sound set is made up of 128 16-bit mono samples, recorded at 50kHz. While the necessary storage for this is 18Mb of hard disk space, the final product will

Wouldn't it be nice if someone turned the Falcon into a full-blown sound module – Vic Lennard gets a sneak preview of just such a program...

probably be supplied on six highdensity disks and uses a compression technique that does not affect audio quality.

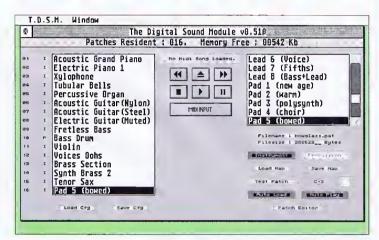

SOUND DECISIONS

With the drums offloaded to the DMA chip, the main processor handles the general program while the DSP deals with the various sound aspects: pitch-shifting for play-back, panning for stereo position, volume level, smoothing and mixing. The final audio then exits via the stereo mini-jack socket on the Falcon's rear.

The synthesis side is yet to be finalised but Martin is currently experimenting with linear interpolation, a smoothing method that improves basic audio quality. All voices will have custom Attack, Decay, Sustain and Release (ADSR) envelopes and sound will be click-free on note release courtesy of a very tail off. If the 16-voice limit is exceeded, there's a clever algorithm for deciding which voice to steal.

UP TO DATE

Just compare *Popyrus* with *1st Word Plus* and you'll see the changes that have taken place in user interface design. *TDSM* is certainly a modern-looking piece of software with non-modal (moveable) dialogue boxes and keyboard shortcuts. Enhanced GEM has been used, including the

TDSM's main window. Even with 16 sounds loaded, there's still 542Kb of free memory.

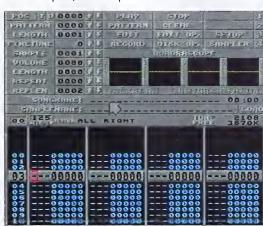

3-D "look" from version 3.4 of the AES, and drag and drop has been implemented.

TDSM can accept input from a MIDI keyboard or plays MIDI File formats 0 and 1 – and impressively well. While the current test sound set is a bit rough in places, the multi-sampled standard acoustic piano is very good. In fact, an average of six samples have been used per sound, so accounting for the necessary hard disk space requirement.

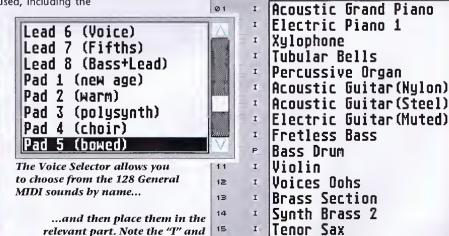

Each MIDI channel will have a filter set, much like the input filters on a MIDI sequencer, and sounds can be remapped to program change numbers for non-General MIDI uses. And even though the supplied sound set is very much at the test stage, I could still load a full 16-part's worth of sounds into a standard 4Mb Falcon. You never know: perhaps there will be enough memory left to load your favourite sequencer and use *TDSM* as an on-board sound module – a true music workstation!

The price should be around £60 which is impressive for a product of this nature. Contact System Solutions (0181-693 3355) for more information.

Pad 5 (bowed)

TDSM's author is responsible for the ProTracker conversion on the Falcon.

"P" next to each part number

for Instrument or Percussion.

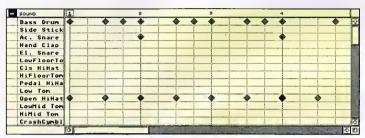

Time to put the pedal to the metal with Ian Waugh...

LET'S GET

eavy Metal is a relatively recent term which basically refers to ultra-loud rock music! Apart from increased amplitude, Heavy Metal is similar to other types of rock but it's also characterised by increased activity at the low end, principally the bass drum or drums.

Louis Bellson pioneered the use of double bass drums in the '40s although it was the late '60s before it found its way into popular music which, at the time, was referred to as Underground. Great names of that era include Jimmy Hendrix (who made much use of guitar FX and distortion popular with today's Heavy Metal music), Eric Clapton, Jeff Beck and The Yardbirds.

As usual, we're using the *Cubase* drum editor to illustrate the patterns. Each pattern is one bar long and the darker the hit, the greater the velocity. The darker hits mean that the beat should be accented – experiment a little with your own system to discover the best velocity settings for each drum.

TOP HM TIPS

- Wear a T shirt and a leather jacket, grow your hair long and learn some power chords. It won't help you play better HM music, but at least you'll look the part!
- Many HM drum tracks feature a deeper bass drum than is commonly used with more standard rock patterns. Modern drum units seem to have a clicky bass drum, more suited to disco than HM. If yours Is one, program a low tom alongside It.
- Can you have too much reverb on a Heavy Metal drum track? Ooh, difficuit one, that – hit the reverb button and use your ears!
- What are Power chords? Versions that are neither major or minor, consisting of the root and the fifth of the chord. A D power chord, for example, contains only the notes D and A. This sounds incredibly, er, powerful, when used with a "big" distorted guitar sound. Spread the chord out across a couple of octaves and you'll have a terrific Heavy Metal sound.

Figure 1: a typical Heavy Metal rhythm with open hi-hats. The main rhythmic pulse ls provided by the bass drum.

HARD HITTING

Figure 1 is a typical Heavy Metal rhythm with open hi-hats. Notice that the main rhythmic pulse is provided by the bass drum. The heavy accents on beats two and four are as much a part of Heavy Metal as they are of standard Rock.

Figure 2 is another common HM rhythm. If you're a drummer, it's also a good way to lose weight! The offset second snare and accent add interest to the rhythm. Figure 3 is an interesting pattern which leans towards jazz – the cymbal rhythm seems to play across the bass and snare.

Figure 4 proves that you don't have to have calf muscles like Fatima Whitbread to play good HM tracks. This one is rather more open but the snare and bass rhythm in the middle of the bar give it a great HM offbeat feel. Try this pattern with the hi-hat and cymbal lines used in the other patterns.

A lot of Heavy Metal is based on rock shuffles which are in triplet timing. Figure 5 is a typical HM pattern in which the bass drum provides the shuffle feel rather than the hi-hat as would be the case in jazz or rock. The open hi-hat is preferred to the closed variety; beats two and four are accented.

Figure 6 without the cowbell is a more open triplet rhythm, the equivalent of the sixteenth pattern in

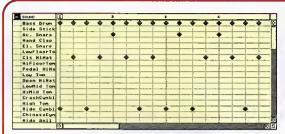

Figure 2: another common HM rhythm - the offset second snare and accent add interest.

Figure 3: this leans towards jazz – the cymbal rhythm seems to play across the bass and snare.

Bass Drun	+_+ + + + + + + + +	Ŷ

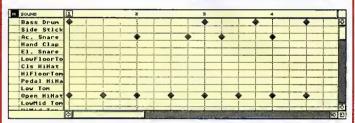

Figure 4: a more open rhythm, but the snare and bass drum in the middle of the bar give it a great HM offbeat feel.

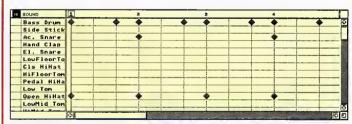

Figure 5: the bass drum gives the shuffle feel rather than the hi-hat. Open hi-hats are used and beats two and four accented.

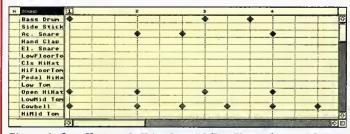

Figure 6: the offset cowbell in the middle of beat three adds a special kind of interest – use a low-pitched cowbell or toms.

figure 4. You could try adding a slightly busier hi-hat or cymbal line too. The cowbell is a slight whimsy. It's not an instrument you normally associate with Heavy Metal but the offset cowbell in the middle of beat three adds a special kind of interest to a pattern. It may sound better if you have a low-pitched cowbell and

you might like to play this rhythm using other drum sounds such as toms. Try it with the HM pattern in figure 5 or with any other triplet pattern you create. Also, try adding it when you want the song to get a bit more busy.

We'll loosen up a bit next month and check out some funky stuff...

HEAVY!

Keyfax Software • £21.95 inc. p&p • 0491 579645

This is the latest MIDI File disk from Keyfax Software whose policy is to use live musicians, real instruments and little or no quantisation. It was apparently recorded at the foot of Corcovado mountain near Rio de Janeiro by a top Brazilian drummer and you can't get much more authentic than that!

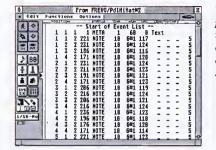

The disk contains 72 files. There are 18 major patterns looped around 16 bars plus lots of fills. Some patterns are duplicated – one has the drums on separate tracks, the other puts all the drums on one track for more editing flexibility.

If you're an expert on Brazilian rhythms you'll recognise patterns such as Afoxe, Baiao, Escola, Frevo and Ijexa. Even if you're not, you'll recognise Samba and Bossa Nova. In any event, think exotic Latin and you won't be far wrong.

There are some extremely interesting patterns here although I do confess a penchant for Latin and Ethnic percussion. The Frevo is characterised by snare drum rolls, a little reminiscent of the theme from *The Avengers* TV series.

One of the Funky Samba patterns. It's quite complex, being constructed from nine drums parts.

The hi-hat in this Frevo pattern is apparently in eighth notes. You can see the offset in the editor but it still sounds spot on!

There are slightly rocky, jazzy and funky versions of various patterns which wouldn't be out of place in a contemporary song.

A characteristic of Brazilian rhythms is that many of them are rather loose (that is, not quantised) and if you look at these patterns in an editor you can see how "off the beat" they actually are. And they sound terrific.

The patterns are mapped to General MIDI although some use drums not normally found in a GM drum set such as Pandeiro and Surdo. However, the manual gives you substitutions you can use. And unlike the manuals for the twiddly*bits disks, this one is the size of a CD insert and you can read it.

Unlike the other disks too, this is the first to include a license agreement. The files are sold for non-commercial applications only. Keyfax says this is principally to prevent anyone reselling the patterns as commercial MIDI Files or, heaven forbid, karaoke tracks but the agreement does state that they are not for general release recordings.

Check out the demo on this month's cover disk...

ST REVIEW COMMENT: "If you like Latin, you'll love this. An outstanding set of original rhythms for the rhythm connoisseur."

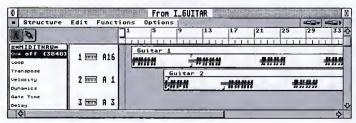

GUIT-BOX GROOVES

Scott's Dots • £15 • 0291 629212

It's nice to welcome a newcomer to the MIDI File production world. Scott's Dots is run by Mike Scott who makes a living producing backing tracks for cabaret artistes.

Guit-Box Grooves is a collection of guitar patterns recorded with a MIDI guitar. The disk contains 43 MIDI Files grouped into pairs, the odd one out being a demo file. One contains just the guitar riffs while the other has some drum and bass tracks so you can hear the patterns in context. There's little variation between backing tracks and they do become a little wearing after listening to them 24 times! And, sorry to say, the backings are the worst part of the files with lots of very high velocity levels and little subtlety.

The guitar parts, however, are much better constructed, although a few still have too many high velocities (some even hit 127) for my personal preference. I do like a little room to manoeuvre although I suppose it's no hardship using a global function to reduce the velocities.

The riffs alternate between two tracks so it's easy to select and copy the chord type you want.

But don't let the backings put you off this disk. The guitar riffs are quite varied ranging from a whole collection of strums and shuffles to various pick styles. There are also some ending strums.

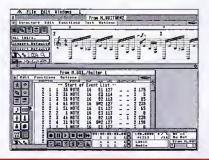

Each pattern is played using major, minor, seventh and minor seventh chords. To use them in your own material, first isolate the required pattern. This is easy as the riffs alternate between two tracks. You then transpose it to the required chord, copy it the required number of times and drop it into your song.

You get a couple of sheets of printed documentation, telling you how to create more complex chords such as major sevenths and ninths by changing or adding more notes to the chord.

However, this isn't totally satisfactory as the timing of these notes is crucial and it could take a while to get it right – after all, that's why you buy files like these

ST REVIEW COMMENT: "A solid, well-constructed set of guitar riffs, easy to use and eminently usable, although without any of the more complex chords."

Jag news!

Tina Hackett rehearses her footy chants and sets off on the trail of Impact Software's brand new soccer sim...

MAKING AN IMARPACT

ndependent software developers seem to be leading the current revival of the ST games scene. With the likes of Caspian Software and Unique Development Sweden, it seems that there will soon be a wealth of top quality games for the ST and, in particular, the STe.

Many developers have realised that the STe's hardware affords the opportunity for more creative and advanced games. Through using its blitter chip and improved colour palette and DMA sound, the quality of software is now reaching new standards.

LEADING FROM THE FRONT

One such developer is Impact Software. Having made a name for itself with *Snacman*, the shareware game, Impact is about to make its move into the commercial market with a new football simulation, *Team*. So after glimpsing a sneak preview of the game at a recent Atari show, *ST Review* rushed down to Northamptonshire to get the lowdown on this up-and-coming new company.

In the unlikely setting of Syresham, a tiny village in the middle of the

B.I.V.

Team
project,
Is also
responsible
for the
music in
H.E.R.O.

Politics at Oxford while the graphics are courtesy of Jocelyne Dave-Vienne, better known for her work on canvas than on the computer. The musician in the team is Greg Lovesy, currently still at school doing his GCSEs. At this point, you could be forgiven for being a touch cynical. But after playing the game for myself and having the theory behind Team explained, all doubts were cast aside.

Northants countryside, we found the brains behind this latest game. After seeing some of the software I was slightly startled, to say the least, to find out that the team consists of a rather unlikely crew. Programming is by 19-year-old Ralph Lovesy, a part-time student in Philosophy and

Ralph Lovesy, programmer, explains how the game will push the STe's hardware to its limits...

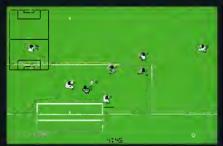

STEP BY STEP GUIDE

IN THE BEGINNING...

The ST footy sim has evolved somewhat since the days of slow, jerky-scrolling, stick-men graphics – and all the playability of a broken hula hoop! The genre seems to have gone through significant stages in development and with *Team* we appear to be on the verge of yet another new era. So it seems pertinent now to take a look at the history of the game. Tina "Jimmy Hill" Hackett reminisces...

Kick Off – the one that started the renaissance of footy games. Dino Dini's classic set new standards with its great gameplay and excellent graphics – at the time...

2 Kick Off 2 – a vast improvement on the original. It retained Kick Off's great playability, tweaking it with aftertouch and sporting enhanced graphics.

Manchester United, the corker from Krisalis.
Although arguably not the best playability-wise, it offered a different, highly detailed graphical style.

Snacman - an early offering from a talented team...

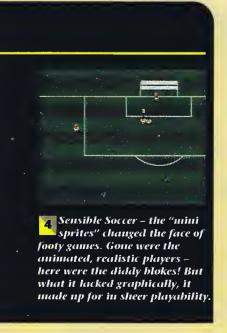

ON THE OTHER FOOT

With the ST market awash with football games, what made Impact choose to create yet another? Ralph explains. "The football games around are pretty sub-standard and suffer badly from jerky scrolling. Besides, no one has ever written an STe-specific one. We wanted to do a game that would squeeze the STe for all it was worth!"

Having a good game alone though is sometimes not enough in this business. How will Impact convince the cynical gamesplayer that they need another football game? Ralph, not looking even slightly perturbed by this predicament replies: "It's going to be everything you've ever wanted from a football game and more!" He goes on to expound on this confident statement. "It will have loads of new features from a hi-tech replay system to more realistic 3-D players. Teom will be STe-specific, making use of the blitter chip for smoother scrolling and the 32-colour palette for more realistic graphics."

And life after Teom? What plans do Impact have for further releases? Ralph is somewhat cagey but reveals that a cartoon-style platformer is on the agenda.

As for his own personal favourites, Ralph certainly has a couple: "Ocean's Sleepwalker game because it pushed the STe's hardware to produce smooth scrolling - but as for playability, it's got to be Kick Off 2!"

TEAM SPIRIT!

So what can we expect from this hot new footy game? Jane Plessey takes a sneak look... IMPRESSIONS

FIRST

Impact has gone all out to make *Teom* push the STe by using the hardware to its fullest. It will need 1Mb to run in and looking at the game, it's easy to see why they've opted to make it STe only.

Silky-smooth scrolling is ensured by clever use of the blitter chip, and some nifty programming enables the game to flow with ease. There's no sign of any jerky scrolling found in various other footy sims.

One of the most innovative parts of the game is the 3-D realism. In previous games, you often found yourself walking through another player resulting in an annoying merge of colours. Now, thanks to a complicated masking technique, the players are solid and three dimensional. So, for example, when you tackle one of the opposition you really have to run around the player. This also happens with other objects like the corner flag or goal posts. If the ball hits them, it makes a realistic rebound.

This is further enhanced by the ball acting under real forces of friction so if it hits the top of the net, its motion is cushioned to some extent. A crash into an advertising hoarding has it bouncing off with quite a force.

Graphics-wise, Teom promises to be rather impressive. The STe's 32-colour palette enables the stadium to look more realistic, even down to the pitch graphics. For example, four shades of green have been used to create the look of grass on the field rather than the usually restrictive crude couple of shades. The crowd will be quite detailed and have animations such as scarves and hats flying into the air when the teams score, providing the game with that all-important match atmosphere.

Music from the game comes courtesy of Greg Lovesy, whose work can also be heard on the soundtrack of H.E.R.O.. Impact boasts that it will be the best music ever heard on an STe. Written with the music program ProTracker 2, it uses 50kHz DMA sound.

One of the most important factors is gameplay and Impact has carefully considered this. Ralph doesn't want to include "aftertouch" and has incorporated a more realistic method of directing the ball. "I believe it is better to have a predetermined shot and know where it's going to go rather than taking the shot and then steering it in the direction you want - it's hardly realistic!", Ralph explains.

The game will include a comprehensive range of options with different pitch conditions to affect the play. You'll also be able to change all the players' names, hair and skin colour. Teom uses all the sides from the USA '94

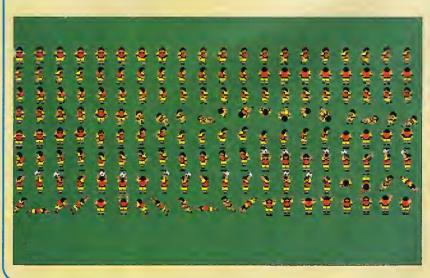

The hall STEVE NICOL acts under the forces of friction for that touch of added realism when it hits the top of the net! ROB JONES

Crowd animations will add a great deal to the match atmosphere.

World Cup plus all current members of the English Premier League. The actual viewpoint for the match will use an overscan mode - no need for a radar - and all the action will be clearly shown.

In developing a football game, a lot of thought has to go into sprite size: will it be the much-loved miniatures of Sensible Soccer or the larger, animated ones in Monchester United? Impact has opted for a mixture of the two, using sprites that are 1.3 times larger than those in Sensible Soccer. All of the players will have their own individual skills, so providing a tactical element to the game. Control is by the usual joystick method but you can also play with a joypad or use the

If all of the promised features are well implemented, and from what we've seen already this is highly likely, then we are promised one jaw-dropper of a game!

A lot of attention has been paid to creating the solid and 3-D aspects of the sprites.

TOTALLY ス ま (7 ま 1)-

f last month's preview of Obsession Obsession could well be the best STe game ever! But don't take our word for it - play and find out...

and the feature on Unique Development Sweden whet your appetite, then this month's exclusive cover disk demo will make you positively drool!

The team in Sweden has prepared a doozie of a demo, just for ST Review readers. This runs on any STe or Falcon with a colour monitor and 1Mb of RAM. If you're working with a hard drive, just transfer the complete OBSESSION folder.

WE HAVE LIFT OFF!

Our demo consists of one of the Obsession pinball tables without the final product's extra missions. You get three balls per game; after three games, Obsession quits to a "reminder" screen for the full game and then to the desktop. A simple double-click on the program has you up and flipping again!

To get started, double-click on OBSESSED.PRG. When the UDS logo appears, hit the <spacebar>. You'll probably want to play the game immediately rather than read the scrolling info, so hit the <spacebar> again, but check out the facts 'n' figures at a later date.

Keyboard controls couldn't be easier: the downward arrow recoils the spring to launch the ball, the two <shift> keys act as the flippers and the <spacebar> "nudges" the table. Take care though - too many nudges and Obsession tilts, losing the current ball in the process.

BUBBLING UNDER

The story-line goes something like this. Bobby Bubble has escaped from Captain Notpolite's secret dungeons and is now heading towards the Sitnalta archipelago to find hidden treasure courtesy of the Captain's treasure map.

The map leads to a strange and

BIG SCORE

Fancy letting your friends know your best high score? Then drop ST Review a line and we'll print the top ten! uninhabited island surrounded by the "Shark's Nest" coral reef.

Bobby dons his diving gear and heads into the warm, but deadly, water. However, Captain Notpolite is watching him from his stealth submarine 137 and, through your performance, Bobby either finds the treasure or ends up as a shark snack!

A look at our annotated pic will

give you some clues on where to aim the ball.

As for the full game, you'll have to wait for next month's review to find out just how good it is...

RAMPING IT UP

The Aquatic Adventure table consists of a number of different ramps and passages...

- On the left side is the Deep ramp, leading to a spring at the bottom left of the table. A visit to this ramp makes Bobby ascend deeper into the coral reef and gives you 50,000 bonus points. Visiting it more often gives you the chance to activate Kickback, gain 2,000,000 points and be rewarded with a safe or extra ball.
- If you manage to spell D, I, V and E, you have the chance to increase your bonus multiplier corresponding to the lights at the bottom -x2, x3 and so on. Shooting the ball into the left passage, where an arrow with "IB" is flashing, increases your bonus. When a Bonus Multiplier is lit, you receive the multiplied bonus after the ball is lost.
- The Starfish ball trap gives random awards from 25,000 points to an extra ball. Light up S, E and A to increase your chances of a big bonus.
- Light up P, E, A, R and L in the seashell to get to the Million Hunt, where you can gain three or, on a second occasion, six million points! Each letter gives you 100,000 points.
- When lighting up H and B on the right side of the table, you get a chance to activate Hold Bonus which means that the current Bonus Multiplier remains intact after the ball is lost.

Finally, a few tips:

- When you launch a ball, aim for the flashing S, E or A to get a "skill shot". Then flip the ball up the right passage for a possible 2,000,000 point bonus!
- If a ball looks like it's going to drop between the two flippers, let it bounce back off the bumper behind them.
- If a ball passes straight through the table without being "flippered", you get the chance to"shoot again".

On a planet many eons away, Tina Hackett exercises her survival skills in Silmarils' latest blockbuster...

very so often a game comes along that really is a breath of fresh air, something so original that it even makes the most cynical of games-players sit up and take notice.

Robinson's Requiem is just such a game – in fact, I've had to drag myself away from the computer to write this review! And that's only because I've broken my arm, gone down with food poisoning and eventually died of dehydration. Well, perhaps I'd better explain...

Search the ruins of your ship for useful equipment.

ROBINSON'S

You are well advised to keep checking your personal computer while you are travelling around. Called the "Sesame", it is worn on the abdomen and is shockproof and waterproof to 100m — very useful for wandering around a hostile planet!

- This is your Electrocardiogram which displays the number of beats per minute. If you have a fever and your temperature is up by one degree, say, then it will raise the heart rate by 18 beats.
- Keep a check on your blood pressure. This can drop if you are short of water or tired, for example, and you may faint.
- Body temperature. Watch this carefully. The normal average is 37.0°C. Try to keep your temperature constant and avoid sunstroke by making a hat out of leaves. Beware of icy water!
- Malaria Indicator: Green healthy subject; Orange presence of a virus; Red danger. The symptoms are intermittent bouts of fever causing violent trembling but it can be treated with quinine.
- Estimated resources: blood, energy and water. On average, three litres of water is lost a day but as much as 12 litres in heat or with exercise. You should also eat more if you have lost a lot of blood.

CONVINCING PLOT

It all started just under 200 years into the future ago (do what? Ed) when I was a young, naïve Robinson candidate. Having been recruited from one of the best military academies, after extensive training, I was placed on various missions to explore unknown planets. After these explorations, my crew members and I were promised a golden retirement on earth.

However, I found out the shocking truth just before my last mission on the planet Zarathustra. The Secret Intelligence agency have chosen to banish us because we may have come into contact with unknown viruses on our travels. They've sent us to a planet with magnetic shields around it and have made the ship crash. We are now in a hostile environment and must learn to survive.

Oh sorry, I seem to be getting off the track here but I am finding it

rather hard to adjust to normality. You see, *Robinson's Requiem* is one of those games that really does take you over. As you've probably realised, this is a survival game and you need to draw upon all your resources (which

Keep your body temperature constant by wearing the appropriate clothing.

It's kill or be killed! Other inhabitants can provide you with handy objects.

Think carefully about how to use items from your inventory on the scenery.

REQUEN

Despite the excellent gameplay, the graphics look rather unclear close-up.

Don't be tempted to drink the water without sterilising it first!

interrupt your dreams.

are rather limited at first) to survive. The game has a great deal of depth so, before you read on, if you're the type who prefers a quick, relaxing platformer or frustration-letting shoot-'em-up then avoid this the plague - a rather appropriate pun! And another word of warning - it is rather slow to play.

But despite this, you tend to get totally hooked once you start playing. For instance, you may be wandering around the jungle terrain with nothing much happening when suddenly you come across a fellow crew member.

But remembering that it is every man for himself, you need to kill him and take certain items from him. Yes. I know it sounds a bit sick but it's all about survival of the fittest and it is only a game after all - and a lot of fun at that!

DROP-DEAD FEATURES!

You need to use all your expert knowledge, especially in matters of health, to check your own fitness. Your personal computer tells you whether you are at maximum health or if you're about to drop dead from hypothermia, gangrene or malaria.

Yes, it may sound like an exotic episode of The Young Doctors but this is real, hard-hitting stuff. One minute you're exploring the land, watching your footing in case you fall and break some bones, while the next you realise your temperature is above average. You panic and wonder what medicine should you take? After a rummage through your medical kit and a quick peek at the AWE (Alien World Exploration) student booklet, you find a match for the symptoms and dig out the necessaries to cure

your fever. A close call... this time! You also need to use your knowledge of which foods can be found in these hostile surroundings and remember that water is not the fresh mountain spring variety either - grab the disinfection tablets. Animals have to be hunted down for food while their hides make good clothing.

Survival is not the only goal. An escape plan is essential if you want to leave this planet and get back to good ol' earth. And as if all the natural hazards of the planet aren't enough to contend with, you meet all kinds of other life forms intent on making your life difficult. The half dinosaur/half hybrid monsters, for example, can be killed for food.

VERDICT

So that's the game, and very good it is too! Unlike most adventure games, Robinson's Requiem is all about realism. And not just the plot - because it is a survival sim, it accurately recreates how the body reacts to various conditions. This might be quite boring on its own, but it works brilliantly when combined with the tense, adventure style.

However, the game is not perfect by any means. It plays rather slowly, even if you change the level of detail and screen size to the minimum. This can become rather tedious and you also seem to be walking around at a snail's pace quite a lot of the time tough going on the patience.

Graphically, it is a bit of a let-down. It creates the setting but tends to be more representative than realistic; objects tend to look rather pixelated, especially when you need a close-up view.

On the plus side, the sound effects and music are very good. Strange animals can be heard flying overhead creating that all-important feeling of tension and the other planetary noises create the atmosphere brilliantly. The dramatic death sequence, for example, is accompanied by a haunting track that enhances the game, as does the introduction.

Despite the few grumbles, this is a good 'un. It combines a good mixture of different elements and requires many different skills. You'll need logical thinking to keep your health in check, tactical skills for hunting and eventually escaping the planet, ability in combat and, most of all, good, old-fashioned, commonsense! A highly original game.

SUMMARY

GOOD POINTS: Huge game that will last tor ages Nail-bitingly addictive with action that keeps you glued to the screen A complete breath of tresh air!

BAD POINTS:Rather too slow to play at times Graphics are rather pixelated

FINAL WORD:

"At last! A totally original game that draws you in completely. Highly addictive.

GRAPHICS SOUND VFM PLAYABILITY

0000000000 0000000000 00000000000 0000000000

es, it's revival of the indies at the moment with many of the new games coming from independent developers. H.E.R.O. from IDS is one such game. Programmed in STOS by Tony Greenwood, it may only look like an average PD offering but looks aren't everything. It's playability that matters so it's time to dig deep and take a look at whether the £9.95 price tag is on the button or not.

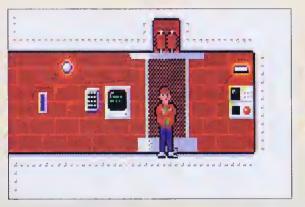

ANYONE FOR COFFEE?

For starters, what you get for your money is an in-depth story line that makes an episode of Taggart look simple! Apparently some clumsy chappy spills his coffee and nearly brings an end to life as we know it in which case most of us would have destroyed the world ten times over! But unfortunately in this instance, the poor chap works in a Bio-Nuclear Complex and spills his Nescafé all over a control panel. This sets off all sorts of reactions, resulting in "Major system warping" and "program slippages". As you can imagine, the proverbial waste really has hit the

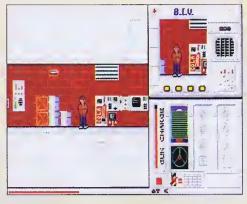

The sum result is the bizarre situation of radiation pools all over the place, trapped personnel cowering in stationery cupboards and the destruct sequence activated. Enter superhero: Batman, Superman and Danger Mouse all rolled into one. Actually, it's Jim McKenzie who has a

definitely

Travel through the different levels via the Teleportation machine.

Time for some refreshment - being a hero isn't as easy as it looks!

Human Extraction & Rescue Operation – it may sound slightly painful but it's the latest game from IDS. Tina Hackett grabs her Indiana Jones gear and goes adventuring for the day...

good knowledge of the complex's domes and tunnels - well, it's more practical than big biceps and dodgy blue tights, I suppose!

FASHION SENSE

Now this is where you come in, dressed in appropriate hero clobber of blue slacks, brown anorak and green T-shirt - who cares about good taste when you're trying to be a Superguy! You have to save the universe from imminent destruction.

To do this, you roam the levels searching for human survivors, micro chips and teleporter suits and cards in order to complete each stage. And if you don't succeed within the

The robots prove frustrating as they move at their own will.

specified time limit, then tough - the corridor becomes filled with radioactive isotopes! At the same time you also have to avoid the game's nasties such as mad robots, laser beams, toxic pools and deadly droids.

OUT OF CONTROL

The joystick control of your character enables you to carry out a wide range of moves. <Up> allows you to climb a wall, jump, look in cabinets and the

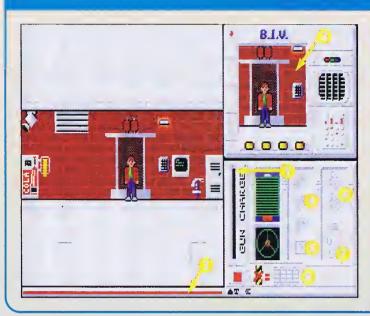

Leap across the deadly pits of lava to avoid being turned into a skeleton.

THE NAME OF THE GAME

- Gun Charge Display don't forget to recharge your gun power each time.
- Display Screen keep an eye on vital info.
- Time Limit Displayer complete the levels in the allocated time or you're history!
- Teleporter Card Displayer you'll need a card to escape on the teleporters to another area.
- Micro Chip Displayer three chips per level are needed to destroy the faulty systems.
- Door Pass Card Displayer some doors are Barrier Doors and you'll need a card to go through them. If you run out, you'll have to use explosives to destroy 'em.
- Teleport Suit Displayer find this to give to your rescued prisoners. They can then teleport to a safe zone.
- Explosives Displayer find them and use them to blow up doors.

like, while <Right> and <Fire> let you run right and do a long jump.

This is all very well in theory but in practice - pah! A lot of the time you find yourself fighting with the controls and carrying out moves you had no intention of, resulting in death far too often. Another point that had me tearing my hair out was the dodgy collision detector; half of the time you can almost run through a laser beam, for example, while merely standing near such a beam on occasions results in instant obliteration

The "Save game" option removes some of the frustration, but the way the obstacles are designed doesn't match up with the controls' response. For instance, when you have to turn around and crouch down quickly to shoot at robots, you simply can't get the joystick to do what you want in time. Highly annoying!

Graphics, as you can see from the screenshots, are rather basic but the simple design makes for a fairly effective cartoony style. The levels are scattered with computer terminals, teleporters and other scientificlooking objects which create a good setting for the complex. However,

there are just too many chunks of white border on the screen, making for a very small playing area.

The main sprite has been quite nicely animated - leave him standing for too long and he mops his brow or grabs a can of cola! The animation also works well when he climbs up walls or crawls across the floor. When the character dies, there is a different animation sequence depending on how he met his fate. Walk into a laser and it's fry-up time, a rather humorous touch. The introduction sequence presents the story well and sets up the right atmosphere for the game

VERDICT

The intro tune is excellent but what follows sound-wise is rather disappointing. Although the sound effects are appropriate to the actions, they start to grate after a while recharging the laser gun produces a horrible whine akin to a demented Trimphone!

For the price, it's not a bad little offering. There are plenty of different objectives to keep the gameplay varied, and many taxing obstacles to provide longevity, but the game is let

The intro screens work well in setting up the game's scenario.

Destruction initiated - you only have a limited amount of time to complete your mission.

down heavily by an awkward control system. And for even the most able gamers, some of the obstacles will prove just too tricky to get round.

SUMMARY **GOOD POINTS:** Good mixture of puzzles and arcade action Nice main sprite animation in-depth plot gives decent game objective **BAD POINTS:** Joystick controls are awkward and unresponsive Graphics are rather basic Gameplay becomes too frustrating **FINAL WORD:** "H.E.R.O. has some good qualities but there are just too many frustrating factors fo make if that 'must-have' titte."

PERFORMANCE OVERALL **GRAPHICS** 0000000000000 SOUND 0000000000000 00000000000 VFM 000000000000 PLAYABILITY

The first game starts off in an easy fashion with a straight-forward matching game.

enowned for quirky puzzler games such as Stork Roving Bonkers and Reflex Action, Dave Cobbledick has just released another offering of much the same nature. Plonker is really a very simple puzzler – but very addictive!

In fact, on loading up the game in the office this morning, it drew quite an audience within seconds. The bizarre sound effects drew my curious colleagues followed by helpful suggestions (not... Ed) as to how the puzzles could be solved.

MATCH OF THE DAY

Let me explain. Plonker appears to be the kind of matching game you played when you were a nipper. But it's more than that. Each round consists of a number of squares and, depending on the level, you have to remember what objects are hidden behind the squares. While at first it's

just a case of matching the shapes (by a process of elimination) and remembering which two symbols are where in a certain number of turns, the game gets harder as you go through the levels.

In all there are five different skill levels, varying from "Speed Fill 'em Up", a fast round where you have to fill up the empty squares with different symbols with no like symbols next to each other, to an "Opposites Attract" round where symbols that are opposite to each other have to be matched.

This is more difficult than it

The timed rounds really do raise the blood pressure!

sounds! It's not just a case of guesswork: you have to think logically and tap into the old memory bank! And life can get even more hectic when you have to look out for bomb squares that instantly remove half of your score. The timed rounds are guaranteed to raise your blood

> Plonker is ideal for those of you who want to test your memory skills...

Tina Hackett digs out her dunce's cap to play the latest puzzler from Dave Cobbledick...

pressure as you race against the clock to complete the round. However, this can also be quite frustrating as the squares don't seem to open fast enough and it's quite chaotic trying to get the mouse on to the right square in time!

BONUS ROUNDS

To add variety, there are bonus games where you need to find the "good" collectibles and avoid the bombs. Also, two different puzzles appear at points in the game. One is the Komeo Of Mors, based on a grid of numbers where the lines must be made to add up to 65, and Colour Turn where you have to memorise a sequence of colours and fill up the square in a certain order.

All this is overseen by a Plonker called Arthur who, at every opportunity, adds his appropriate comments on your progress. This is everything from "Well done, level cleared." to an annoyingly gloating laugh whenever you lose a life! But these samples add a great sense of humour to what could have been a rather dull game. The quiz show host-style animations also add a nice touch.

VERDICT

The graphics are adequate enough for this sort of thing, with a clearly set out screen, and the tunes create the corny game show atmosphere. With such a light-hearted approach, *Plonker* is certainly more than just your average puzzler.

Does it all justify the £9.99 price tag? I'm not totally convinced due to the lack of real variation and the existence of various shareware alternatives, admittedly of an inferior quality. But while you may find this quite tedious if you're not into puzzlers, it does have one very dangerous quality – it is highly addictive.

Each time you play, it has you believing that with one more round you'll have it cracked.

TOMTAR

POWER PD • DISK NO: PWR 475 • 99P • MEMORY: 1MB • STE ONLY • SHAREWARE • FALCON-COMPATIBLE

IN BRIEF: Maybe it's just the time of the year but we have another completely bizarre offering this month in *Tomtar*. Yes, you'll love this one – you play a gun-toting Grim Reaper that is trying to kill small, furry creatures called Tomtars! While the concept is rather basic, it has been carried out so well that the game really does work, especially with the long, animated intro

that gets you into the mood and adds to the comical feel of the game.

Standing on the left side of the screen, the baddies

The storyboard intro has a great cartoony style with nice graphics and an atmospheric tune.

come at you from the right and it's blast-'em time with your mouse-driven machine-gun. Direct the cross-hair at the desired baddie and click the left button, blasting the little critter into oblivion!

Yes, it's great fun. You get that lovely warm feeling, the same one as when you nuke all your Lemmings and, quite frankly, I like playing the bad guy and there's nothing better than a story where the good guys don't always win.

The game looks great too with a comical Grim Reaper character and

tonnes of the little creatures invading the screen. The backdrop is well created with outlines of skulls swirling together in a sinister cloud.

Sound effects are sparse but the machine gun sound samples are authentic and really provide that all-important blasting feel.

ST REVIEW COMMENT: "Although there isn't much variety here, for a quick burst of blast'-em-up action you can't go far wrong, especially with this bargain disk that also contains the excellent sequel to *Pacman on E's.*"

Oh yes, I've always wanted to play an evil Grim Reaper-type character!

PACMAN ON E'S 2

POWER PD • DISK NO: PWR 475 • 99P • MEMORY: 1MB • STE ONLY • SHAREWARE • FALCON-COMPATIBLE

र्गाह

IN BRIEF: Grab your whistles, Pacman's in the house! Yes, that drug-induced character is back again for a 1994 remix. And this time around he's brought his mates. In this, the final and registered version, there are now 100 levels, new animations, improved sound and different mazes which promise to make this the ultimate version.

And as if you didn't know, you're a Pacman racing around a screen of mazes, avoiding ghosts and picking up bonuses. But in this case, the collectible items are E's which speed Pacman up and turn the ghosts blue, at which point he can eat them. Hmm – there's a moral in there somewhere folks!

Yes, it is Pacman again – but it is accompanied by superb rave tunes, brilliant samples and lots of bright, new shiny graphics. For instance, pick up

a speed token and you are treated to a Roadrunner, "Neep, Neep!" sample. Or collect an "E" and a deep, booming voice reinforces this with "Eeeel".

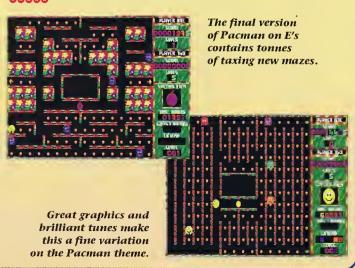

Two Pacs can play at the same time – work as a team or as arch rivals! The many different mazes have been redesigned for a taxing challenge as well as providing a bit of logical thought. There are a number of different collectibles such as dancing strawberries, peeling bananas and question marks. Some are good, some bad so you have to remember which is which or in the case of the question mark, you'll have to get it first to find out!

The source code for this game can be bought for £5 from Stuart Innes, 49 Brownhill Rd, Caithness, Scotland KW14 7NL.

ST REVIEW COMMENT: "Two player mode adds to the fun and two chums can play simultaneously either as team mates or arch enemies, trying to kill each other. One of the Pacs is the usual yellow dot while the other is another yellow dot with dishy cool specs added so you'll know who's who!

"This really is the ultimate Pacman game and, with all the new additions, superb addictive gameplay, and brilliant tunes, I'd recommend it to everyone."

COCCO

Overscan Invaders is a well-executed version of a much used. but still popular, theme.

OVERSCAN INVADERS

FLOPPYSHOP • DISK NO: BUD 4666C • £2.75 • MEMORY: 0.5MB • LICENCEWARE

IN BRIEF: Another well-executed but basic concept: Overscan Invaders is a variation on the much-used Invaders formula. There are plenty of aliens to blast from your base, making for some exciting and addictive gameplay.

Although the idea dates back to the beginning of computer-time, this version is enhanced with 32-colour graphics and four-channel digital sound. Control is via the keyboard which makes life a lot easier as you can only move left and right, fire.

The music is up to today's standards and the pace of the tune

changes with the speed of the game: when the aliens are speeding at you, the music changes to a tense, countdown tune which makes for end-of-level nail-biting to say the least!

ST REVIEW COMMENT: "Although this is an old concept, it is one of those timeless classics that can be used over and over again. This version is very well presented with sharp, clear graphics, appropriate music and great gameplay. It still remains as addictive and appealing as ever."

SCORE: 000070 H1: 000280

Sprites are well designed, making the screens look very attractive.

DEMON

FLOPPYSHOP • DISK NO: FWG.08C • £3.00 • MEMORY: 1MB • LICENCEWARE • FALCON-COMPATIBLE

IN BRIEF: 3-D Dungeons and Dragons-style games are hardly a rarity these days and they have to be something really special to make the grade. At first glance, Demon appears to have plenty going for it and a good deal to offer the discerning adventurer with lots of baddies to kill, spells to cast and items to collect.

Unfortunately, the presentation lets it down – and big time. The main screen is divided into various different sections (the inventory, spells and the like) but the actual 3-D playing area is minuscule - you simply can't see enough of what's going on.

The sound effects don't fare much better either and yes, while it has been created in a rather "tongue in cheek" style, the effects, such as whining ghosts, really do start to grate on the nerves.

ST REVIEW COMMENT: "The graphics and main screen lose their appeal very quickly and although the programmers have tried hard to create a decent atmosphere, the overall setting looks terribly dingy and

"The game takes far too long to get started and a lot of the time you end up wandering around with nothing much happening. All in all, it's not a particularly original idea and has very little to offer gamers."

At first you find yourself captured in a gloomy prison cell. Time to plan your escape...

SKATE TRIBE

ASCIILUM PDL • DISK NO: GAM 74 • £1.25 • **MEMORY: 0.5MB • PUBLIC DOMAIN**

IN BRIEF: Remember the craze that swept the nation not so long ago? No. I'm not talking about Deely Boppers, (remember that desirable fashion accessory?) but skateboarding. There wasn't a day that went by without a simple shopping trip to the local Newsagents being hindered, nay, made possibly life-threatening, by a bunch of youths who had decided to set up weird and wonderful ramps via your front door step in order to compete in their skating championships!

But luckily this pastime has made its way onto your local ST to make life safer for unsuspecting Grannies and shop owners everywhere. Skate Tribe allows you to play a hip, ace skateboarder who shows his prowess through a busy street full of obstacles.

Using the joystick, you guide him around potholes, trees and the usual, everyday obstacles that make life difficult for yer average skateboarder...

ST REVIEW COMMENT: "This is quite a fun game but is hindered by an awkward control system. In a nutshell, it's quite difficult to master and gain proper control over.

"The actual idea for the game is a good one, so makes this quite a reasonable offering. Pacier music and more responsive controls would benefit this title - and possibly have it reaching up towards the four or five-star mark..."

ALIEN INFESTATION!

In the month that Alien vs Predator hits the streets, Nial Grimes struggles through the hype to bring you the latest Jaguar news from around the globe...

t's here! After what seems like an eternal wait, Atari has finally pushed Alien vs Predotor through the doors. Stocks will be a little limited in the UK for the moment, but the situation is sure to be remedied as the Christmas push begins.

The game itself has had an enthusiastic reception from most quarters, and it certainly looks like being a system seller, if only for the gorgeous texture-mapped graphics. You can read exactly what we thought of the finished product in this very issue...

VIRTUA SHOCKER!

As news of Sega's investment in Atari went to press last month, more details of the deal began to emerge. Not only has Atari's share price rocketed by over 22%, but it also seems as though we can look forward to Jaguar conversions of some Sega arcade games. The Virtuo series is almost certainly included, but thankfully Sonic is a 64-bit nightmare that we won't have to endure!

In fact, there is evidence to suggest that Atari has been working on a Virtua Fighters clone for some time. What's more, one of the designers of the original Sega title is said to be in on the Jaguar project (currently code-named "Fight for Life") and one or two Jag driving sims in the pipeline bear more than a passing resemblance to Virtuo Rocing already!

Meanwhile, Atari has revised its original estimate for Jaguar sales this year – it's down from 300,000 to 200,000. With over 100,000 units already out there, and vast amounts of quality software piling up for a Christmas launch, they might well reach that goal. Atari president Sam Tramiel is on record as saying that at least some of the cash injection will be used in marketing the Jaguar towards the end of '94.

Doom on the Jaguar is said to have better shading than the PC version pictured here.

Christmas
promises to be
an exciting
time for
Jaguar owners
with Williams
working on
several coin-op
conversions,
including
Double
Dragon 5.

Jag Doom promises better designed levels than its PC counterpart, and a fair turn of speed!

JUST WILLIAMS

Veteran coin-op manufacturer Williams has been responsible for some of the most lethally-addictive arcade games ever produced. Joust, Defender and Robotron were all created by the company and Jaguar owners will soon be able to enjoy vastly updated versions of these very games on their system. Phrases like "immersive experience" and "compelling gameplay" are being bandied about already and when it comes to titles like Defender, you really want to believe them!

Jeff Minter is handling the Defender conversion personally (Yes, Yes, Yes!) and we are promised a game that retains all of the original's frenetic action. With Tempest 200 available now and Bottlezone well on the way to completion, it seems as

though Atari is playing the nostalgia card quite strongly. Williams will also be publishing a range of games under its own label. *Double Dragon 5*, the classic beat-'em-up, and *Troy Aikmon Footboll* are both pencilled in for a Christmas debut.

DOOM & GLOOM

Doom, id Software's shockingly atmospheric blast-'em-up, has to be one of the most eagerly awaited games for the Jaguar. Well, the wait is nearly at an end; the game is in the final testing phase and should be approaching release as you read this

The production version is said to run at between fifteen and twenty frames per second (as opposed to Alien vs Predotor's 12) with a resolution of 160 by 180 pixels. This

gives significantly less definition than the PC version, but the true colour graphics provide much finer shading and at the end of the day, you are not going to notice a great deal of difference.

The author describes the game's speed as being roughly equivalent to that of a mid-range 486 PC, but is quick to point out that it wasn't designed with the Jaguar in mind. From this we can conclude that if the Jag does take off, the sequel will feature a graphics engine more tuned to the 64-bit platform.

This month's news brings with it the distinct feeling that the long wait for "killer" Jaguar software is finally coming to an end. Sure, there are a couple of Crescent Galaxys on the way, but Tempest 2000s also seem to be arriving in strength...

Jeff Minter has somewhat of a pedigree when it comes to producing Defender clones, but the Jag outing should be definitive!

Virtua
Racing,
along with
a number
of other
Sega titles,
could be
appearing
on the
Jaguar
very soon...

he club is smoky, figures ill-defined in the sultry lighting. You pull up to the bar and order a cold beer. A voice slides out of the dork, somewhere close. You turn and see the ideal figure of your dreams; perfect gender, height, looks. You speak, your mind afire with the possibilities inherent in this chonce meeting. They speak. In minutes you're slipping out of the smoky haze, into the warmth of o cob."

Wolfenstein3D - the game that led to a million seller for ID Software in the form of Doom. This is the 3-D maze game that places you in the character of American, BJ Blazkowicz, the fearsome gore-machine, superjock and all-round steroid-happy uber-mensch (er, enough of the hyphens... Ed). It's some time in the later stages of World War II and Hitler's evil war-machine is geared towards a scientific solution to the pesky problem of those incorrigible Allies.

Which is as good an excuse as any for a game dripping with Nazi stormtroopers, Gestapo officers, German Shepherds and the various results of horrific genetic experiments. All of which you, as BJ, have to blow away in quick succession. W3D is not a game of great strategy — if it moves blast it, if you can't, get a bigger gun.

JOBS FOR THE BOYS

There are six missions to smash through, each with a number of levels and an end-of-mission guardian. The number of levels per mission increases as you go through the game, as does the difficulty and the power of the guardian. Each level consists of a maze of corridors, rooms, doors and hidden panels. Strewn around the maze are a number of different object types including weapons, ammunition, health, keys and stolen Nazi gold.

Weaponry, ammunition and health

Killed the guard, loads of health, but what's beyond this door?

... ah, just another guard - he's history dude!

EDGE GAMEPLAY ENTER STILL OF S THE TOTAL OF

It's time to hit the bunkers – no, not the coal ones but Hitler's second World War hiding place. Graeme Rutt advances, pistol in hand...

are central to your well-being. You are always equipped with a pistol and your trusty – but useless – knife, but unless you find a sub-machine gun, and in later missions a chain-gun, you won't stand a chance. Topping up your health is a constant worry: you only have one life and it's very easy to get blown away very quickly. Luckily, Red Cross health packs are abundant and collecting treasure can even boost your health above the "top" level of 100%.

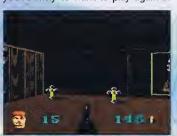

On the larger, more complex, levels it's easy to become almost totally lost. Thankfully you can flip into map mode at the press of a button, which brings up a scrollable screen detailing everywhere you've travelled.

Wolfenstein3D isn't an overtly tactical game, so it lives or dies on its graphics, sound and blastibility. It wins in most of these areas, with one exception, and is by far and away the best version of Wolfenstein available on any platform. The graphics are very well drawn and when combined with the eerie (although not top quality) soundtrack, the bump of doors opening and closing around you and the semi-intelligent aspect of the adversaries, gives rise to a very atmospheric game. When you blow away the competition, satisfying

amounts of blood splatter across the screen and screams, howls and yaps accompany the death throes. In fact, if you're a parent thinking about Christmas presents you should certainly consider your child's sensibilities before buying them W3D.

VERDICT

The main gripe is an insufficient number of different weapons and foes to fight against, but this is likely to be the case until games can intelligently create new types of object. Consequently, Wolfenstein 3d is a little on the uncomplicated side and is pretty easy to finish. I managed to complete it in seven days in "easy" mode – and it isn't the kind of game you're likely to want to play again in

Sod the treasure - I'm dead meat. I want my Mommy...

SUMMARY

GOOD POINTS: Great Graphics

Good Atmosphere

BAD POINTS:

Limited weapons and foes Too easy to complete

FINAL WORD:

"A game with excellent heritage and a lot of atmosphere, but perhaps too limited for the modern game player."

average or hard mode. In many ways, this game is analogous to a very pleasant, highly enjoyable one night stand.

So, if you want a technically able game with lots of atmosphere, a modicum of gore and one that doesn't require much thought, then maybe this is for you. If you're running on a limited budget and don't have to have every Jaguar game then you should await Alien vs Predator or Doom, both of which promise to have more weapons, enemies and better game-play than W3D.

"Morning. They've gone. Left sometime in the early dawn. A warm smile of remembrance twists your lips. But now it's over..."

The interactive movie has arrived! Pulse rifle in hand, Nial Grimes grabs a fresh pair of socks, and enters the ultra-tense world of Alien vs Predator. Sigourney Weaver? Nowhere...

Aliens come charging out of the darkness as you try to reload your gun vain...

he stasis pod opens with a loud hiss. Your custodial sentence is over, but there's something wrong - fellow crewmen lie motionless on the floor and the whole ship is sealed off, the result of a condition red emergency. So begins your quest to rid Training Base Golgotha of an alien infestation and rescue the surviving members of the crew. You start the game with nothing more than a shotgun (discovered soon after emerging from stasis) and a good supply of rounds - extra energy and ammunition can be collected along the way.

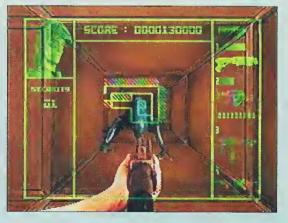

The sound effects add to the tension of the mission. The faint hum of the ship's engines fills the air, and all of the samples have been taken from the Aliens film. When you let off a few rounds with the pulse rifle, it sounds like a pulse rifle, and the same goes for every other effect used. Occasionally, you hear the eerie clicking of the Alien Queen enough to strike terror into the heart of this rough 'n' ready journalist.

But the audio delights pale in comparison to the graphics. This game is represented through the

most amazing 3-D system you have ever seen in your life. The picture spreads into all four corners of the monitor and a semi-transparent control panel has been laid over the top. Aliens come charging out of the

darkness as you stumble backwards letting off shots as fast as possible. What's more, the whole thing moves very smoothly and only when a monster jumps you from behind do you wish that there was a bit more urgency about the screen updates!

Some floors can be accessed only through the air-ducts bumping into an alien down here is no fun!

Product: Alien vs Predator Price: £59.99 Graphics: Sound: Value For Money: Playability: **OVERALL**

FACTS 'N' FIGURES

Details of the plot emerge as you begin to use the computer panels – it ain't pretty!

Bad breath is no defence against this little sucker - a spot of joypad wiggling is called for!

The pulse rifle makes short work of alien pods, but you'll need a level 1 security pass to find it.

FIRE

ANY OBJECTIONS?

The temptation is to view AVP as Doom with aliens - an out and out shoot-'em-up - but there's a lot more to the game than that. In fact, it's best described as an arcade adventure, with the emphasis firmly on exploration. Although aliens are waiting behind almost every door you open, the main challenge is finding security passes and making your way to new floors in the complex. Many of these can only be reached via air-ducts and you need to make good use of the mapping system to get very far. In common with the control panel, maps are laid over the centre of the screen and you soon get used to reading them while dealing with any aliens that insist on getting in the way - yeah, bug soup!

Although the manual gives a general idea of the plot, it's up to you to search for the details. Computer panels are built in to most areas of the station and are packed with reports on the nature of the aliens and schematics. In line with the movie atmosphere, there are no levels as such, but it is very progressive in slowly letting you get at the harder obstacles. Alien eggs aren't encountered until the training maze for example, and the same goes for the bulk of the bad guys. It feels like a totally interactive experience and yet in reality you are being led on a subtly planned route through the game.

That's not to say that the gameplay is perfect. In the film, the aliens' acid blood ate through the floor and yet in AvP it forms a pool and robs you of energy should you walk over it. Admittedly the effect is small, but it's still annoying considering that the easiest place to zap the rotters is in Pest control,
'90s style!
Aliens
explode into
a pool of acid
that zaps
your energy.

a doorway. However, this minor inconvenience is counterbalanced by numerous nice touches in the presentation - aliens try to claw their way into airducts as you move through them and the marine comes up with all sorts of comments as new weapons are discovered. Add to that the horribly satisfying squelching noise that accompanies a splattered alien egg and you get some idea of the degree of atmosphere that AvP creates. In fact, it's not long before you find yourself muttering quotes from the film under your breath very sad indeed!

ADDED EXTRAS

The colonial marine game is obviously the main attraction of *AvP*, but there are also two other scenarios to play: an Alien or the Predator. Although the same impressive graphics engine is used for both, they somehow don't measure up in terms of atmosphere or gameplay and besides, who wants to play a bad guy anyway?

The Alien outing fares reasonably well, the overall aim being to rescue

the Queen. Speed is on your side, but you only have a claw, tail and telescopic teeth to fend off the enemy. Extra lives can be obtained by cocooning the unsuspecting marines, but that's far easier said than done – in fact, the whole affair is very, very difficult indeed. The Predator, on the other hand, has the equally tricky task of collecting the Alien Queen's skull. Unfortunately that's the only goal and it all gets boring rather quickly.

It's an arcade adventure without very much adventure and there's just not enough to keep you occupied for any length of time. It's as though the programmers wanted to make a game based on the *Aliens* films and just slotted Predator in at the last minute.

Of course, the big question when it comes to any title costing nearly sixty quid is longevity – just how much enjoyment is it going to provide? Well, the scenario is huge and it's the sort of game that you will play until you complete it (sleep or no sleep). Judging by my own progress, I can't see that taking much more than a month, but the satisfaction level is high – it's a real buzz to discover a new floor, or gain a level 5 security pass.

There are still the Alien and Predator games to think about after that, but they don't have the same "grab you by the throat" (or some other part of the human anatomy... Ed) appeal.

SUMMARY

GOOD POINTS:

Drop-dead looks Movie-style atmosphere Strong gameplay

BAD POINTS:

Alien acid The abysmal Predator game

FINAL WORD:

"Alien vs Predator creates movie atmosphere like no other game — it's the first of a new generation."

DAMN AND BLAST

Alien vs Predator is based on films aimed at an adult audience and the gameplay does reflect that to a degree. Having said that, it's the atmosphere and tension that make it such a scary experience. The strategical marine gameplay is also likely to appeal to more mature players. Atari has given AvP an "advisory" 13 certificate, but both of the Aliens films were rated 15 or above – draw your own conclusions!

Alien vs Predator is a landmark title. The marine section has a strong plot – this is one of the most atmospheric games ever released...

ST Review would like to extend its thanks to:

ST UPGRADE

KEEPING TRACK

Some time ago, I mentioned that I've used a trackball for many years. How did I start? Well my MIDI sequencing package of the time had a nifty graphical editing page and I figured that a trackball would help me to draw straight lines more easily. I started off by purchasing the original Atari 8-bit trackball, a black box so huge that you couldn't click on both

ORDER HOTLINE AND SPEAK TO KEITH FOR

buttons at the same time! It also took up more space than a mouse and pad, somewhat negating the benefits. I persevered until 1991 when I decided to write an article on trackballs during the course of which a Buyers' Guide was introduced. This gave me the perfect opportunity to try out all the contenders.

One trackball won by a street. I ended up buying it and still use it with my Falcon and ST. Unfortunately, the Newcastle-based company vanished off the face of the Earth, so my buying advice was of little consequence – until I saw the identical trackball being sold at a computer show by Gasteiner. This is the one on offer in these pages.

Would a trackball suit you? Try this simple test. Load up your favourite art or graphics package and try to draw a straight line from left to right. Chances are that you'll move up or down at some point. With a trackball, your fingertips just roll the ball for a far more accurate result. Also, our trackball has a third button that acts as a locking left one – you don't have to hold the left button down as you scroll around on-screen, freehand-style.

Personally, I would never use a mouse if given the option of a trackball. Try one — you may be pleasantly surprised...

12 REASONS TO BUY FROM ATARI ST REVIEW...

All the products offered by ST Review have been carefully selected by us as the best in their class. But top quality does not mean top price. Thanks to our huge buying power we can deliver top value for our readers too.

- ✓ All memory boards are populated with memory
- ✓ All memory boards are individually tested
- ✓ All STFM upgrades use the Marpet connector system, acknowledged to be the easiest way to upgrade an STFM
- ✓ Expert support from a top ST engineer is just a telephone call away
- ✓ Prices include VAT and postage & packing the price you see is the price you pay
- ✓ No minimum order and no credit card surcharges
- Memory upgrades carry an exceptional five year warranty and other products a full 12 months
- ✓ 28 day no-quibble money back guarantee
- √ 24-hour order hotline
- ✓ Because we only sell a few items, your order will normally be supplied straight from our large stocks
- ✓ Your credit or debit card will not be processed if the item you order is not in stock
- Experienced technicians are available for advice before placing an order

ALL MEMORY UPGRADES INCLUDE FREE DISK!

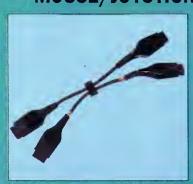

Each memory upgrade comes with a free disk including memory test software, RAM disk, print spooler and disk copier, all to ensure you can make the most of your new memory upgrade...

MOUSE/JOYSTICK EXTENSIONS

Either a single or twin joystick adaptor will save you from the ST's most common hardware fault – a broken mouse port. Changing from mouse to joystick is that much easier if you have extension cables.

from £3.99!

MOUSE

The ST may be a great computer but the mouse that comes with it simply is not up to scratch. The ST Review mouse is a major enhancement because it uses microswitches for the buttons, making it much lighter and easier to click. Our mouse also has a much higher resolution – 280 dots per inch which means you need far less desk space and get much finer control.

CLOCK CARTRIDGE

Who sets the time each time they switch on their ST? If like many thousands of ST owners you don't, then you are missing out. Every time you save a file it gets stamped with the time and date – invaluable when you are hunting for a file. Get a clock cartridge and the time will be set automatically each time you switch on your ST.

ST REVIEW BINDER

ST Review is the essential ST magazine – and our custom binder will help you to keep your back issues in pristine condition. No more searching under the bed for last month's issue! Our green and gold beauties will accept up to 12 issues and allow you to read any issue of ST Review without having to remove it.

- The ST Club, 7 Musters Road, West Bridgford, Nottingham NG2 7PP. Tel: 0602 455250.

Loading times in Speed of Light 3.5 have been slashed even further and the whole package is far more stable.

SPEED OF LIGHT 3.5

FLOPPYSHOP • DISK NO: BY NAME • £2.00 MEMORY: 1MB
 SHAREWARE **FALCON-ENHANCED**

IN BRIEF: Speed of Light is well known among the ST graphics community as the fastest picture viewer available, and version 3.5 looks set to reinforce that reputation. Although primarily it's a bug-fixing mission (the .GIF save routines have finally been nursed to health) the author has taken the opportunity to bolt on a whole host of extras.

In addition to lightning fast .JPG and .GIF loading, you can now warp pictures, and palette-switching tricks are used to make sure that pictures look classy despite the limited number of colours offered by ST Low resolution. The whole program has been tweaked even further for speed and you'll now find a glossary of all the tricky image-processing terms on-disk. In actual fact, tests show that Speed of Light is faster than GEMView when dealing with .GIFs.

ST REVIEW COMMENT: "The main bugs in the initial release have been crushed and Speed of Light 3.5 can now take its place alongside the cream of ST graphics software. You can also look forward to some pretty hefty new features when you register."

00000

Image warping is just one of the incredible features that keeps Speed of Light well ahead of the competition.

Choosing the right sprite, screen or sound is made easy thanks to an iconladen tool-panel.

Full documentation for Movie Master is included on-disk along with a rather

MOVIE MASTER

flash text viewer.

GOODMAN INTERNATIONAL • DISK NO: GD.2380 £1.95 • MEMORY: 0.5MB • SHAREWARE

IN BRIEF: Multimedia is a buzzword in the computing industry at the moment and you don't need an expensive PC with a CD-ROM to experience the phenomenon; Movie Moster will allow you to produce presentations on the ST, albeit with a few limitations.

The program is based around the use of sprites and screens to create an animation. Backgrounds are imported in a range of standard formats and Sprite Moster files are also supported directly. Putting together a show is very straightforward once the various objects are loaded - for example, a moving sprite can be defined by simply dragging the mouse. The animated frames are shown as you work in the editor, so you do get a good idea of the finished product.

Having said that, there are aspects of the program that make it rather frustrating to use. For example, there's no way to add or remove sprites from an animation; you're stuck with the original set-up. A range of spot sound effects can be used to brighten up presentations, but unfortunately there is no way to import samples.

All of these features are explained through a short on-disk manual. Registering the program costs just a fiver and a copy of Sprite Master is thrown into the bargain. An ample range of example sprites are also included and all have been skilfully crafted into a large demo animation. If you don't have Sprite Moster, blocks can be cut from Degos or NeoChrome pictures to produce the necessary frames.

Memory seems to be handled quite efficiently and you can expect to get some fairly impressive animations out of a megabyte machine. The only serious problem with Movie Master is the fact that there's no runtime program – the only way to distribute your work is to include the whole package...

ST REVIEW COMMENT: "Movie Moster has its quirks, but it remains quite a fun program. While not supremely powerful, it is straightforward to use and you can expect reasonable results within seconds of kicking the

package into action. With a more considerate interface and a few more features it could have been a classic." 000

The number of sprites. screens and blocks is defined at the start

KOZMIC 4

GOODMAN INTERNATIONAL • DISK NO: GD.2380 • £1.95 • MEMORY: 0.5MB • FREEWARE

IN BRIEF: Think of "pattern generation" (...ond the first thing thot springs to mind is "knitting" – Ed) and the word Kozmic is likely to emanate from your lips. It's one of the best-known pieces of ST shareware ever written and some of the images produced by this surreal art package have even been used to spice up pop videos!

Although this latest release is still the same Kozmic 4 we all know and love, the shareware restrictions have been removed and it now holds freeware status. In other words, you can use it to death without worrying about paying your debts to software society. All operations are controlled through a mouse-driven interface and full on-line help is included. A couple of companion disks containing some Kozmic artwork have also been released by the author this month.

ST REVIEW COMMENT: "Kozmic is a classic piece of ST software if ever there was one. You can spend hours just adding extra patterns or cycling colours and the fact that it's now free is an extra bonus!"

Mind-blowing psychedelic patterns can be produced easily with Kozmic - switch on the colour-cycling and prepare to be quite amazed!

IMAGELAB

GOODMAN INTERNATIONAL • DISK NO: GD.2368 • £1.95 • MEMORY: 0.5MB • SHAREWARE • FALCON-COMPATIBLE

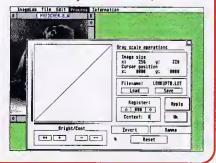

IN BRIEF: Scanned mono images are all well and good, but there's very little you can do with them in the way of image-processing effects. *Imagelab* is a clever suite of utilities that skilfully work their way around this problem — a dithered mono image can be converted to greyscale, effects applied and then the finished product fed into your favourite desktop publisher. All of the programs feature a suave GEM interface and are very easy to work with despite the German documentation. A short tutorial file (in English) briefly explains the role of each of the programs and even includes a couple of simple examples to get you started.

Although the central image-processing program works with greyscale pictures internally, the actual screen display is in mono, which can make some of the effects difficult to see. Nevertheless the range of practical (rather than stunning) effects on offer is good.

ST REVIEW COMMENT: "Imagelob is a perfect companion to any mono desktop publisher. Its ability to deal skilfully with dithered images is almost unique and there are no worries on the usability front. However, a basic

understanding of imageprocessing is essential due to the distinct lack of English documentation."

> The screen display may be mono-only, but Imagelab packs a lethal punch of processing power!

TOP TEN GRAPHICS PROGRAMS

1 SPEED OF LIGHT 3.5 • FLOPPYSHOP • DISK NO: BY NAME • £2.00 • MEMORY: 1MB • SHAREWARE • FALCON-ENHANCED

Speed of Light is one of the best picture display systems available for the ST. It's incredibly fast when dealing with .GIF and JPEG files, includes a range of image-processing effects and even manages to display more than 16 colours on a standard ST. This latest bug-fixed version is the bizzo!

2 KOZMIC 4 • GOODMAN INTERNATIONAL • DISK NO: GD.2380 • £1.95 • MEMORY: 0.5MB • FREEWARE

Kozmic 4 is art for the artless. It allows all sorts of colourful patterns to be overlaid on your ST's screen and the colour palette cycling will drive you wild. What's more, you no longer need to pay a penny for experiencing this little piece of ST public domain history.

3 SPRITE WORKS • FLOPPYSHOP • DISK NO: FWP.19C • £7.00 • MEMORY: 0.5MB • LICENCEWARE • FALCON-COMPATIBLE (PART)

Sprite Works is an extension to GFA BASIC. It provides a whole range of new graphics-oriented commands and the on-disk demos show just how powerful the system is. If you're thinking about games writing with GFA, consider this an essential purchase.

4 IMAGELAB • GOODMAN INTERNATIONAL • DISK NO: GD.2368 • £1.95 • MEMORY: 0.5MB • SHAREWARE • FALCON-COMPATIBLE

Imogelob is designed to work in tandem with mono scanners. It allows dithered pictures to be converted to greyscale and the central image processor program provides a good deal of power. Most of the prompts are in English, but you will have to cope with German documentation.

5 PHOTOCHROME 3 • MERLIN PD • DISK NO: MPD.1517 • £1.25 • MEMORY: 0.5MB • SHAREWARE

PhotoChrome may be getting a bit long in the tooth, but it still kicks botty when it comes to displaying true-colour pictures on the ST. Full advantage is taken of the STe's enhanced colour palette and an accompanying display program allows you to build your own slideshows.

6 JET EMULATOR • FLOPPYSHOP • DISK NO: UTL.4536 • £2.00 • MEMORY: 1MB • FREEWARE • FALCON-COMPATIBLE

Jet Emulotor is rather a quirky graphics viewer. It deals solely with DeskJet and LaserJet .PCL files and displays them on the screen in a GEM window. It works very well as long as the data isn't compressed and could be helpful in diagnosing printer/software problems.

7 GENESIS • MERLIN PD • DISK NO: MPD.109 • £1.25 • MEMORY: 0.5MB • SHAREWARE

Genesis is yet another fractal generator, but instead of producing pointless abstract patterns, it draws even more pointless landscapes. Seriously though, the pictures it comes up with are quite impressive in a "wonder what on earth you could do with them" type of way and it's guaranteed to keep you amused for a few minutes.

8 DMJ GIF 3 • THE ST CLUB • DISK NO: GRA.147 • £2.25 • MEMORY: 0.5MB • SHAREWARE

DMJ-GIF sits in the shadow of Speed of Light these days, but it's still a very good piece of software. It allows 256-colour .GIF pictures to be converted to Spectrum 512 files that the ST has no trouble in displaying. It also does a good job of scaling pictures down and is reasonably nippy in operation.

9 MOVIE MASTER • GOODMAN INTERNATIONAL • DISK NO: GD.2380 • £1.95 • MEMORY: 0.5MB • SHAREWARE

Turn your ST into an animation studio with Movie Master! Sprites, backdrops and sounds are all easily controlled though an icon panel and it even runs happily on a half meg machine. In terms of power it leaves a little to be desired, but it's ideal for beginners.

10 GEN-ART • FLOPPYSHOP • DISK NO: F.4659 • £2.50 • MEMORY: 0.5MB • FREEWARE • FALCON-ENHANCED

GEN-Art is a rather quirky pattern generator. It's designed to make the most of any screen resolution and the results are best described as "interesting". A Falcon enhanced version is supplied but sadly, true-colour screen modes are not supported – and are we disappointed? Oh yes indeedy!

PDZONE

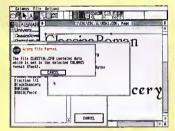

A good mixture of display and body fonts are included in the collection and the quality is pretty good.

CALAMUS FONTS

THE ST CLUB • DISK NO: FON.143 & FON.144 • £4.50 ALL IN • MEMORY: 1MB • PUBLIC DOMAIN • FALCON-COMPATIBLE

IN BRIEF: Font collecting is addictive for most Calamus users and you can always rely on the public domain to come up with a good "fix" every so often. This two disk set comprises some sixty fonts varying in style from the very readable ClassicaRoman to more decorative styles such as Florence Light. There are also some specialist typefaces such as Fraction and Barcode. Unfortunately, while the quality of the fonts is reasonable, the format clearly needs some attention – quite a few produce an error message when loading into Calamus

Sadly, quite a few of the fonts refuse to load into Calamus 1.09, and SL produces a few extra casualties.

1.09. Mind you, the rogues don't seem to take up an awful lot of disk space, so you're not wasting vast amounts of money on unusable fonts.

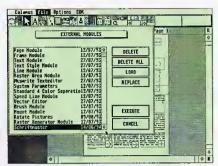

ST REVIEW COMMENT: "This collection can hardly be described as the cream of public domain *Calamus* fonts, but it does contain a few good, usable typefaces. The downside is that at least a third produce some form of error message when loaded into *Calamus 1.09* and the situation is slightly worse under SL."

FONTSHOW

FLOPPYSHOP • DISK NO: BY NAME • £2.00 • MEMORY: 2MB • SHAREWARE • FALCON-COMPATIBLE

IN BRIEF: There are literally hundreds of Calamus fonts available in the public domain and finding the right style for a specific document can be a nightmare. FontShow is a Calamus SL module that can help to solve this problem by printing out a font test-sheet.

The module is a piece of cake to use – just load up the supplied *Calamus* document, select the module itself and then choose the font you'd like

FontShow operates as a Calamus SL module, so can be used from within the package itself.

to preview. A few seconds later a data-sheet will emerge from your printer, listing the path of the typeface in question, every character available and examples of type at various sizes. It does get a little bit confused about page orientation, but switching from "Automatic" to "Portrait" in the print dialogue box soon sorts that out. Unfortunately, the example text is all in German, but it should be fairly easy to make the necessary translations to the document.

ST REVIEW COMMENT: "FontShow is a nice idea, and it makes short work of building up a comprehensive Calamus typeface reference. The fact that you can use the module from within SL is a big bonus and the only minor gripe is the lack of an English test sheet."

0000

The resulting font test-sheets are extremely comprehensive, - but the text is all in German.

CFN-LIST

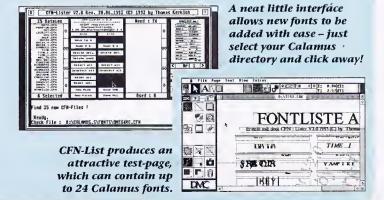

00

FLOPPYSHOP • DISK NO: BY NAME • £2.00 • MEMORY: 0.5MB • MONO MONITOR REQUIRED • SHAREWARE

IN BRIEF: CFN-List is much the same as FontShow in principle, apart from the fact that it's designed to run as a stand-alone program. This means that it works happily with all versions of Calamus, and instead of dumping font samples directly to the printer, it saves a .CDK which you can output at your own leisure.

The program is used through two windows contained within a GEM dialogue box. Your *Calamus* fonts directory is listed on the left and new typefaces can be added to the test sheet by simply clicking on their names and prodding the "move" button. Up to 24 fonts can be included on each page, although all you see is the title – a full character-set listing is not given. Shareware persecution comes in the form of a hefty delay at the beginning of each session, and unfortunately the program doesn't seem to be fully Falcon or SL-compatible.

ST REVIEW COMMENT: "CFN-List is useful in that it provides an overview of a large number of fonts in a small space. It's ideal for the home user and the program is easy to work with, despite the lack of English documentation."

New Prices as From October! 1 DISK - £2.00 2-4 DISKS - £1.75 ea. 5-9 DISKS - £1.50 ea. 10-14 DISKS - £1.25 ea.

All disks require a COLOUR system unless: 'H' - High resolution monitor required, 'A' - Any setup suitable.

PD ZONE

Quite a number of programs can be piled into One-Jack and it will even allow default parameters to be passed.

ONE-JACK

FLOPPYSHOP • DISK NO: BY NAME • £2.00 • MEMORY: 0.5MB • SHAREWARE

IN BRIEF: When it comes to using a cramped hard disk, nothing is more useful than a program launcher. Of course, the public domain is literally heaving with the things, but the ace up *One-Jack's* sleeve is its ability to run as a desk accessory. This means that you can continue working with your favourite desktop replacement, but still have the convenience of a launcher at hand

The way it accomplishes this seemingly impossible task is rather sneaky – in fact programs aren't run

	ECLIPSE		
Preferences Save Land			
			Preferences
			Save Load

One-Jack may sound trendy, but the inherent restrictions make a replacement desktop a more attractive option!

from the accessory at all! Instead, you just select an entry in the panel, quit to the desktop and double click on JRUN.PRG. In turn, this runs the selected program and saves you having to root around your hard disk. JRUN can be assigned a keystroke under later versions of TOS, but in that case you might as well just put the program on the desktop in the first place!

ST REVIEW COMMENT: "If One-Jack worked exactly "as advertised" there would be very little to touch it. However, it's just a little bit too fiddly to be worth the hassle at the moment. If you really need quick access to all of your programs, use *Gemini 2*."

000

S3-ST

GOODMAN INTERNATIONAL • DISK NO: GD.2375 • £1.95 • MEMORY: 0.5MB • FREEWARE • FALCON-COMPATIBLE

IN BRIEF: More and more people these days are giving up their Filofax or notepad in favour of an electronic organiser. The Psion 3 is king among this breed of handy travelling companions and \$3-\$T\$ is all you need to persuade the little perisher to talk to your \$T\$. This is no twenty-minute hack either – it's a dedicated piece of software, with a squeaky-clean GEM interface.

Installing the program is relatively straightforward

A superb on-line help system provides all the information you need to unite Psion and ST as a team.

- the ST side of things is handled via a custom program and a separate utility is provided to port the necessary code across to the Psion. All you need to buy is the serial interface and cable. Full on-line help is included and the whole thing looks extremely easy to use. Unfortunately I was unable to actually test the program in use – fancy lending me a 3a, Psion?

ST REVIEW COMMENT: "Let's face it – if you own a Psion, S3-ST would be essential regardless of whether it was intuitive or particularly powerful! However, the programmer has obviously put real effort into the program and the result is a quality piece of software."

The Installation procedure is totally automated – just select the destination drive and you're ready to roll!

GRAPHICS LIBRARY FOR C BEGINNERS

FLOPPYSHOP • DISK NO: BY NAME • £4.00 • MEMORY: 1MB • PUBLIC DOMAIN • FALCON-ENHANCED

IN BRIEF: In principle, *GLCB* is a programmer's dream come true. It's a universal library that aims to make games on different platforms completely

compatible at a source level. It provides facilities for sprite animation sound, mouse events and plenty more besides. The package claims incarnations on the

> Brief English Instructions do grace GLCB, but all of the source code comments are In French...

ST and Falcon, Amiga, PC, Macintosh and X-Windows. Unfortunately, the ST source code is set up for use with *Pure C*, but a *Lattice C* conversion shouldn't be too difficult.

Although documentation is adequate, it doesn't go into huge amounts of detail on the functions available and beginners are probably going to feel at a loss. Mind you, there are plenty of example games included on the disk, and simply leafing through the source code can tell you a lot about GLCB.

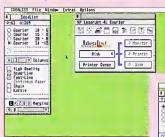

ST REVIEW COMMENT: "GLCB is a great idea, but it's hard to see it becoming a new standard for games programmers. With a few more

Lattice-C File Edit Search Block Options Program Project Tools

8 | Section 1 | Section | Sectio

functions and clearer documentation, it would be a different matter. Nice idea though!"

Quite a number of example programs are supplied and should complie on anything from a Macintosh to an ST!

The two main windows allow you to tweak the configuration and output finished documents.

विविधाः

The page layout can be viewed on screen before any paper is wasted – oli, it's economical alright!

IDEALIST 3.5

CIX BBS • ATARI.ST/2LISTINGS AREA • FREE • SHAREWARE • FALCON-COMPATIBLE

IN BRIEF: Desktop publishers and document processors are all well and good, but they can be overkill if you simply want to print a copy of a long-winded public domain instruction manual. It's in these situations that *Idealist* really comes into its own – it produces great looking documents with the minimum of fuss and will push your printer to the very edge of its performance curve.

In common with most major shareware packages these days, the program looks fantastic on-screen, with windowed GEM dialogue boxes and icons everywhere. The vast majority of modern printers are supported directly and that includes everything from humble LC-10 right up to the latest LaserJet 4. The program is controlled through two main panels – one to handle printer specific settings while just about everything else is crammed into the second. Reformatted text can be displayed on the monitor as a miniature preview, dumped to disk or sent directly to the printer. All sorts of trendy layouts are possible and the amount of text you can squeeze onto a page is frightening! In fact, there are so many parameters to play with, it can be a bit mind-blowing at first.

Over and above support for your printer's internal fonts, GDOS or SpeedoGDOS can be used if installed. It's a bit tricky to select a font and you need to go digging in configuration files to do anything sensible, but a few examples are provided. Perhaps the best aspect of Idealist is that it runs as a desk accessory, meaning you can use it alongside a standard word processor or text editor. It deals happily with the .RTF format produced by many ST, PC and Mac word processors, as well as the statutory 1st Word Plus files. Idealist is supported in the UK by Joe Connor, so you can order your registered version without the risk of sending cash abroad and at £13.00 it's very good value for money. You can contact Joe at 65 Mill Road, Colchester, Essex CO4 5LJ.

ST REVIEW COMMENT: "If you need to print large amounts of text, *Idealist* is unmissable. It takes a little while to get used to the interface, but once your margins, columns and headers are set up, it's all plain sailing. Suffice to say that with the package installed as a desk accessory, it's unlikely that you will ever want to see the 'Show, Print, Cancel' dialogue box again!"

00000

Idealist can be a bit baffling at first, but don't worry - the interface's bark is much worse that its bite.

A liandy queue allows multiple documents to be stacked up ready for output.

TOP TEN UTILITIES

1 IDEALIST 3.5 • CIX BBS • ATARI.ST/2LISTINGS AREA • FREE • SHAREWARE • FALCON-COMPATIBLE

Kick your printer into shape with a little help from *Idealist*. This superb printing utility will take any ASCII, .RTF or *1st Word Plus* file and turn it into a beautifully formatted document. The margins, headers, footers and number of columns are all fully adjustable.

2 S3-ST • GOODMAN INTERNATIONAL • DISK NO: GD.2375 • £1.95 • MEMORY: 0.5MB • FREEWARE • FALCON-COMPATIBLE

This package is the complete solution for connecting a Psion 3 to the ST. It allows files to be transferred quickly and easily between the two machines and also supports a few nice extras such as remote printing. It's extremely easy to set up and the documentation is nicely written.

3 MEMWATCH 1.2 • THE ST CLUB • DISK NO: DMG.42 • £2.25 • MEMORY: 1MB • SHAREWARE • FALCON-COMPATIBLE

Ever wondered exactly how much memory is being gulped up by your favourite applications? In that case you need *Memwatch* – the very best memory monitor. It runs as an accessory and provides a constantly updated gauge of used RAM.

4 WATCH • THE ST CLUB • DISK NO: DMG.42 • £2.25 • MEMORY: 1MB • SHAREWARE • FALCON-COMPATIBLE

Yet another utility which proves that nothing is too pointless to appear in the public domain. Watch simply displays a pair of eyes that follow the mouse pointer around the screen. As an accessory, it works alongside almost any GEM application and I guarantee you won't be able to resist the temptation to make the poor guy cross-eyed every now and again!

5 SPEEDOMETER • THE ST CLUB • DISK NO: DMG.42 • £2.25 • MEMORY: 1MB • SHAREWARE • FALCON-COMPATIBLE

Speedometer provides a real-time display of your computer's horsepower. It's best used under a multi-tasking environment and gives an idea of the amount of processing power currently being used. Yet another gadget that's guaranteed to brighten up a dull desktop.

6 BUGABOO FALCON • FLOPPYSHOP • DISK NO: F.4453 • £2.50 • MEMORY: 1MB • FALCON (RGB) ONLY

Users of *Turbo-Assembler* will be pleased to learn that *Bugaboo* (its partner in crime) is now fully Falcon-compatible. It's still one of the best debuggers available and the only trouble is that it insists on using an RGB screen mode – big trouble if you're running on a VGA monitor.

7 ASCII-VIEW 3.8 • THE ST CLUB • DISK NO: DMG.40 • £2.25 • MEMORY: 0.5MB • FREEWARE

Let's be honest – the ST's built-in text viewer is abysmal. *ASCII-View* is yet another utility that kicks out the "Show/Print/Cancel" dialogue box and replaces it with a fast text display system. It's fully mouse controlled, but keyboard shortcuts are included for every single operation, which will no doubt please experienced ST users.

8 ASSEMBLER 2000 • FLOPPYSHOP • DISK NO: FWG.03 • £3.00 • MEMORY: 0.5MB • LICENCEWARE • FALCON-COMPATIBLE

Fancy a dabble in the world of bits, bytes and registers? If so, take Assembler 2000 for a test drive. It's a no-frills package that is aimed squarely at beginners and a demo game is included to get you started.

9 GRAPHICS LIBRARY FOR C BEGINNERS • FLOPPYSHOP • DISK NO: BY NAME • £4.00 • MEMORY: 1MB • PUBLIC DOMAIN • FALCON-ENHANCED

The *Graphics Library For C Beginners* promises great things in terms of cross-platform compatibility. It provides a range of games-oriented functions and source code is included for several machines including the ST, Amiga and PC. Oh for a few more features!

10 ONE-JACK • FLOPPYSHOP • DISK NO: BY NAME • £2.00 • MEMORY: 0.5MB • SHAREWARE

Program launching from a desk accessory is a great idea, but sadly *One-Jack* doesn't quite live up to its bold claims. It provides a good number of slots alright, but running each program is a two-stage process. If you can bear that thought, it's worth a look.

PD ZONE

Exact details on the new commands are included in the documentation, but ali of the comments are in French...

FALCON GFA PATCH

FLOPPYSHOP • DISK NO: F.4633 • £2.50 • MEMORY: 1MB • SHAREWARE • FALCON ONLY

IN BRIEF: GFA BASIC is one of the most popular programming languages ever to grace the ST. Its blinding speed and structured nature won the heart of many Atari coders and it retains a large following down to this day. Unfortunately, GFA Data Media dropped the ST version some time ago and as a result it was never upgraded to take advantage of the Falcon. The patches contained on this disk will do just that – simply pop the supplied programs in your Auto folder and all of a sudden GFA will be able to use 256-colour screen resolutions. Examples are included for the commands that are affected, although you'll have to dust off that old French dictionary to make any sense of them!

ST REVIEW COMMENT: "If you are still battling on with GFA on the Falcon, this disk has got to be worth a try. Despite the French documentation it is relatively easy to pick up the new commands – it's just a shame that you need to run the Auto folder programs before the patches work."

000

The extra colours offered by the Faicon can be accessed easily through most GFA graphics commands.

525

FLOPPYSHOP • DISK NO: F.3962 • £2.50 • MEMORY: 0.5MB • PUBLIC DOMAIN • HIGH DENSITY DISK DRIVE REQUIRED

IN BRIEF: Almost every computer these days has the ability to attach sound samples to system events and the Falcon is no exception. A problem arises though when you want to use "foreign" samples with Falcon sound managers such as *SAM*.

525 is a sample conversion program that blitzes this common headache. It derives its name from the fact that five different formats are supported including .WAV, a popular PC format; .SND, the Macintosh standard; .AVR, the norm on the ST. Translation takes place through a window-based dialogue box and the sample rate can be changed as well as the format. You can even apply one of two effects to the sound namely: volume maximisation and fade in/fade out. Unfortunately, there's no way to play samples from within the program, but obviously that's not a problem if you have SAM installed.

ST REVIEW COMMENT: "525 will deal with the vast majority of sound samples in the PC and ST public domain. The interface is beautifully easy to use and the only fly in the ointment is the lack of bulk conversion facilities."

Both the frequency and format of a sample can be adjusted through 525's exceilent GEM interface.

The Import Info dialogue box provides all sorts of useful information about the sample in memory,

PLAYMPEG 0.6

FLOPPYSHOP • DISK NO: BY NAME • £2.50 • MEMORY: 1MB • SHAREWARE • FALCON ONLY

IN BRIEF: JPEG is rapidly becoming the industry-standard professional graphics format thanks to its incredibly powerful compression system, and its sister format, MPEG, is starting to make inroads into video-animation.

PlayMPEG is a utility that uses the Falcon's DSP to deal with the goliath task of decoding these animations.

The first thing that strikes you about the player is its speed; it leaves

PlayMPEG displays movies at a breakneck speed and leaves similar Mac and PC utilities standing!

similar utilities on other machines at a standstill! A quarter-screen MPEG movie plays at a shade over 13 frames a second and what's more, version 0.7 is said to be at least 30% faster! There is no interface as such, but you can play a movie simply by dropping it on the *PlayMPEG* icon – a report on the speed is given before the program quits.

The unregistered version is limited to greyscale only, but the full-colour release costs just a fiver!

ST REVIEW COMMENT: "PlayMPEG is a truly incredible technical achievement. On a practical level, it's a little less impressive, simply because

there aren't very many good MPEG animations available at the moment. Still well worth a look to remind you just how hot your Falcon is!"

> Even greater frame rates are promised for the next version and the registration is only a fiver!

£6.95

If you have just started to use an Atari computer then this pack is just right for you. It contains a paint program, wordprocessor, spreadsheet, database, label printer, some essential utilities. and a selection of educational programs and games. All programs will work on a standard 520ST(E or FM) with a colour TV or monitor

Save £5.00

Int. ST Machine Code £14.95

Introducing ST Machine Code is an excellent book that takes the beginner step-by-step into the secrets of programming the ST in assembly language. The accompanying free disk contains a complete programming environment - there is no d to buy a separate assembler or resource kit! The books 24 chanters introduce the gamut of ST applications programing from formatting a disk to constructing drop down menus and dialog boxes.

Textstyle

Another cracking program from Jeremy Hughes, author of Imagecopy. Enter your text into Textstyle, select a Calamus or GEM font, add text effects and justification, and the resulting picture file can be imported into a whole range of packages. Great for generating headlines for wordprocessors like First Word Plus, Redacteur or Write ON; or use it with an art package such as PixArt or HyperPaint to make posters, banners, logos, greetings cards, etc. Thousands of applications.

Do you want a
bit extra from
your ST's desktop
– more powerful
functions and
a faster way
of working?
Ofir Gal surveys
the possible
alternatives...

ALTERNATIVE DESKTOPS

hen the ST first appeared, the Atari desktop was one of the system's main strengths. As opposed to the command line approach of DOS and the like, you could simply double-click on icons to start programs, delete files by dragging them to the trashcan and make use of lots of other features which we quickly learned to take for granted.

Yet there are always going to be those who want more! One such user, Dan Wilga, took it upon himself to write an alternative desktop for the ST and created what has become the most popular product of its kind – NeoDesk.

However, NeoDesk was not the only desktop available and gradually several other replacements appeared on the market, some commercial, others in the public domain.

THE ATARI DESKTOP

What is the standard desktop? It's a program like any other, permanently stored on the ROM chips along with TOS. This is its greatest advantage, as it is loaded faster than any disk-based desktop. It is designed to launch other programs, copy files, format disks and set system options in a graphical environment, freeing you from the need to type DOS-like commands.

The desktop appeared with the first version of TOS and was not improved a great deal until the arrival of the TT and MegaSTe where it

The Atari
desktop, from
1985 (left) to
now. Even the
latest offering,
NewDesk (right)
still leaves a
lot to be desired.

Desk File Une Dition District Dist

received a major overhaul and a new name – NewDesk. The main features of NewDesk are the ability to place icons on the desktop and to assign different icons to programs; various PD utilities have appeared for adding new icons to the desktop.

Up to 20 programs may be assigned a keyboard shortcut and each desktop option can also be assigned a shortcut. Programs can be made to load files by dragging the file and dropping it over the program icon

As a whole, NewDesk, which is now available to all ST users by upgrading to TOS 2.06, is a fine system. But it is still nowhere near as good as any of the desktop replacements on review here.

The Falcon desktop is almost identical but adds modern-looking animated colour icons.

The MultiTOS desktop is the same, but also supports dragging and dropping multiple files onto program icons. All the desktop alternatives featured here support all of the NewDesk features – and much more!

GEMINI 2

Gemini has been the most popular shareware desktop in Germany for many years, the latest version bringing both *MultiTOS* and *MagiC* compatibility. Its status in Germany has allowed it to set the standard for GEM programmers, most notably the AV protocol for communication between programs and accessories.

Gemini supports colour icons and all the bells and whistles you can imagine. It is memory hungry and nowhere as fast as TeraDesk but has some unique features not found in any other Atari desktop, such as a console window where TOS programs can be run, courtesy of the powerful Mupfel Command Line Interface. A large selection of CLI scripts are included and in this respect, Gemini surpasses all other alternatives.

Files can be viewed as miniature icons or text in the same window and also uses *GDOS* fonts for display. It supports *Kobold* and a whole range of utilities that use the AV protocol. There's a recoverable trashcan and the

package includes a large number of colour and mono icons. New ones may be added by using a resource file editor such as *Interface*. And yes, you can install pretty background pictures!

Gemini displays icons and text in the same window. The "console" is a powerful tool in experienced hands.

BUYER'S GUIDE

UNDER THE SPOTLIGHT...

Here's the facts 'n' figures to heip you compare the four main replacement desktops...

	Product	Company	Contact	Price	Colour icons?	File groups?	TOS windows?	AV protocol?	Background pic?	
	TeraDesk	Freeware	PD Library	N/A	×	×	×	×	×	
E	Gemini	Shareware	PD Library	N/A	1	×	1	✓	1	
ĺ	Ease	System Solutions	081-693 3355	£39.95	✓	×	✓	1	✓	
ı	NeoDesk	Compo Software	0487 773582	£59.00	1	1	×	×	1	

NEODESK 4

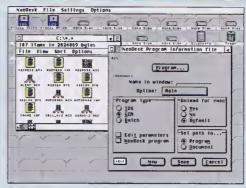

Despite the heavy competition and the long delay between this version and its previous incarnation, NeoDesk remains a firm favourite of UK and American users, though not in Germany. There is no doubt that NeoDesk has more features than any of the other desktops, including background copying, file grouping, environment setting, a recoverable trashcan, GDOS fonts and more.

NeoDesk 4 was designed with Geneva in mind, but works well on all machines. It's multi-tasking friendly – several dialogue boxes can be open at the same time. Its custom user interface has received mixed reactions from users. Generally, you either love it or hate it!

Each directory window has its own menu bar and various buttons allowing independent control. You can toggle between icons and text display, select and deselect all items and there is even a separate trashcan for each window.

File groups are probably the most innovative feature of NeoDesk 4. This lets you create ghost copies of files and programs and group them in various ways. So a single copy of a file can be made to appear in different locations without having to make additional copies of it.

NeoDesk supports both colour and monochrome icons and includes a fully-featured icon editor.

NeoDesk 4 features a redesigned user interface with non-modal dialogue boxes and 3-D buttons. The context-sensitive help facility is extremely helpful while getting to know the program.

NeoDesk is the only desktop able to perform background file copying without external help.

EASE 3.1

Ease is gradually taking the place of *Gemini* in Germany and is also gaining popularity in the UK. It was designed with *MogiC* in mind, but works equally well under TOS and *MultiTOS*. Like *Gemini* it supports *Kobold* and the AV protocol to run TOS programs in a window.

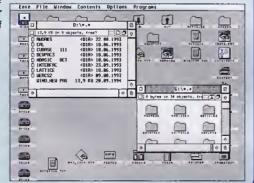

The program has various unique features such as a Mac-style menu and the use of the right mouse button for extended functionality. Unlike the other desktops in this survey, there is no limit on the number of applications with a keyboard shortcut. Each installed icon also appears in a pop-up menu which is available by double clicking on the desktop, useful for access under a multi-tasking system.

It allows each window to use icons or text independently of other windows and even remembers the setting for each drive and folder. Installed programs can be assigned optional parameters and the flexibility of this part of *Ease* is second to none. The use of several custom buttons at the top of each window also goes a long way to providing you with a quick way of changing between icons and text, iconifying a window or closing it.

Sadly lacking are keyboard shortcuts in dialogue boxes, and the program can be a little slow at times. *Eose* uses *GDOS* fonts for display if installed and

includes a versatile colour icon editor along with a host of other utilities.

Ease is the ideal partner for MagiC. It can display icons in one window and text in another, and also uses GDOS fonts.

TERADESK 1.4

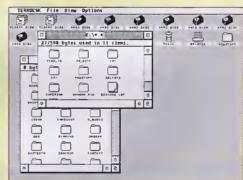

If you are running a TOS version earlier than 2.0x, *Teradesk* provides you with a simple and friendly desktop that is just as powerful as NewDesk. It also has the added advantage of being absolutely free, available from most PD libraries and BBSs.

TeroDesk is very small, with a file size under 100Kb and similar memory requirement, making it usable even on a floppy-based system. It supports MultiTOS and mimics all the NewDesk features such as the ability to place icons on the desktop and drag and drop files on programs to launch them. Applications can be installed so that a double-click on a specified file type launches them, passing optional parameters. Up to 20 programs can be assigned a keyboard shortcut.

TeraDesk also gives you the option to display dialogue boxes in windows and to install an optional file editor. Whenever you double-click on a file, a dialogue box opens and gives you the option to view, edit or print the file. The file viewer can display text or binary files in a GEM window. TeroDesk comes with a selection of icons, and additional icons may be added using a resource file editor.

This is a fine program which is economical both in price and memory

requirement and is definitely worth a try before investing in a commercial desktop.

TeraDesk offers simplicity and speed, two advantages that make it well worth trying.

RAM	Unloadable?	GDOS fonts?	Features	Effectiveness	Documentation	Ease of Use	Value for money	Overall
150Kb	×	✓	5	7	7	9	10	76%
600Kb	1	1	8	8	No English docs	8	10	68%

TAKE IT EASY!

Well and truly infected by the desktop publishing bug courtesy of last month's cover disk giveaway? It's Nial Grimes to the rescue with some practical Easy Text Pro advice...

very avenue of computer use is packed with jargon, and desktop publishing is no exception. Many of the terms have been inherited from the print industry and as such bear little relation to everyday ST lingo.

This month we are going to look closely at dealing with the two main elements in any document – text and graphics. We'll meet plenty of jargon along the way, but grasp this little lot and you will be well on the way to conquering the basic principles of DTP...

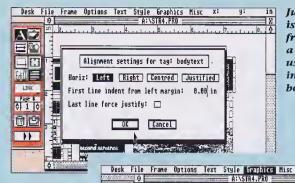

TAG ALONG

Of all the many tools at a desktop publisher's disposal, "paragraph tags" are certainly one of the most useful. Once you begin to put longer documents together, you'll notice how tedious it is to select huge chunks of text to simply change the style or font – especially so if the whole lot is linked through a number of frames. Paragraph tags allow you to apply a predefined style to larger

sections of text. In the case of Easy Text Professionol, they serve an even more important role, because some typographical effects simply aren't possible without the help of a tag or two.

Eosy Text Pro handles paragraph tags in a very straightforward way. Just to the right of the Edit button in the control panel is the Tag icon and once highlighted, a simple click on a paragraph is enough to send you leaping into the appropriate dialogue box. The fourteen tags available are listed down the left-hand side, while on the right are the changes you can make to those tags. At this point it would probably be a good idea to run through the options available, as they neatly cover the basics of typography.

To start at the top, the tag names can be changed. The first four entries are already defined, but when adding more, it makes sense to reflect the font and size in the name – "Dutch 14" for example. Just for reference, everything you import or type is styled as "bodytext" by default. The

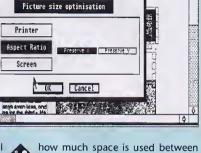

Editl 🗮

| Page 8 | 0 1 | 0

++

Justified text is handled from here. It's a good idea to use a first line indent for body text.

Bitmapped pictures can look very good - remember to size them to suit the resolution of your printer.

font and size dialogue box will already be familiar to you, as will the text style section. Bear in mind that the changes you make will affect both the paragraph you have selected and also all other paragraphs marked with the current tag.

RIGHT ON

Alignment is one of the main reasons for using a paragraph tag as it's the only way to use right-justified text. First line indent is also useful when dealing with body text. It places a space at the start of each paragraph, which is a technique used by most magazines to improve the readability of articles. As a general rule, you'll want to leave the "force justify" button unchecked – stretching the last line of text in a paragraph to touch both borders usually looks tacky in the extreme.

Especially important when dealing with fully justified text is letter spacing, and adjustments in this department are handled through the typography box. It's all to do with

how much space is used between the characters in a paragraph — tracking refers to a constant gap, while letter spacing changes (within certain limits) to make justified text look a little more natural. As if that isn't confusing enough, character spacing is measured in "ems", or the width of the letter "M" in the selected font. Yep, it's a case of fiddling with the settings until the page looks right!

The spacing dialogue box is in a similar vein; it deals with the gap used between lines, namely the leading. Auto-adjust works well for most purposes, but bear in mind that leading is measured in "points" (or 1/72 of an inch) if you do want to fiddle with the settings manually.

Now all of this might sound horribly complicated, but don't worry – once the styles are actually defined, it's just a case of highlighting a paragraph to change, clicking on the name of the tag to use and you're outta there! The nice thing about tagged text is that it can be easily changed at any time. If you

STEP BY STEP GUIDE

STAND IN LINE

Having trouble getting to grips with paragraph tags? In that case, let's use your new-found knowledge to add the finishing touches to last month's tutorial document...

Load up your almostcomplete page and draw a medium-sized text frame on the screen. Click the edit icon and type "Faith & Honesty (Probably)", using <Return> where necessary.

Now highlight the paragraph icon and click on the words you've just typed. The tag dialogue box will appear.

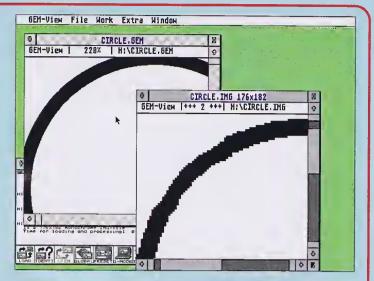

Select any unused tag and give it the following attributes: right justified, white, 12 point, Dutch. Click on "OK", apply the new style to the remaining lines and you're in business!

BITS 'N' PIECES

One of the trickiest DTP concepts to grasp is the difference between bitmapped and vector artwork. You can look upon bitmapped images as pictures drawn on a huge piece of graph paper, the overall effect created by lots of little black squares. If you enlarge the graph paper with a photocopier, the straight lines are going to look jagged as each little square, or "pixel", is doubled in size. The same thing happens when you enlarge a picture in an Easy Text Pro document. This neatly highlights the main failing of bitmapped images – they are resolution dependent.

Vector art on the other hand works on an entirely different principle. Instead of describing every single point in the picture, a vector image is made up from primitive graphical shapes – lines, circles, curves and so on. When the ST is asked to draw a circle with a radius of, say, 2cm, it can do so once at screen resolution and a second time with more definition for the printer.

Now if all of that is just a bit too much to comprehend, simply remember to keep an eye on the size of bitmapped pictures, the .IMGs, .DOOs, .TNYs and .PI3s of this world...

The difference between bitmapped and vector images shows up quickly as you begin to enlarge them.

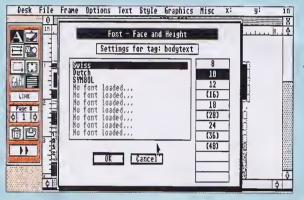

decide that 12-point body text would be better than 10-point, you can change the whole lot in one fell swoop by simply fiddling with one tag!

GET THE PICTURE?

Graphics are just as important as text in desktop publishing, but making them look good on the page can be difficult at times. Eosy Text Professional supports a range of different graphics formats, but they all fall into two main categories – bitmapped and vector. The difference is explained in the Bits 'n' Pieces box.

Although bitmapped pictures are sometimes limited in resolution, there is a lot you can do to make sure that they look good when they reach your printer.

Your first port of call should be the size optimisation dialogue box, which can be found lurking in the graphics menu. Here, pictures can be sized, or "scaled", to suit either the screen or printer; the aspect ratio can also be dragged into line. In an

Changes made at this point affect all paragraphs tagged as "bodytext".

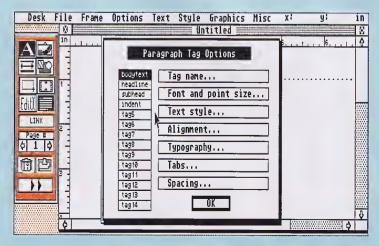

resolution. As you can see, there's more to using pictures within documents than meets the eye. If you find yourself struggling to grasp the basic principles, simply import the same picture into a document a number of times and experiment with the size optimisation dialogue box.

And now I'm sure we've given you more than enough jargon to cope with for one month! Keep practising what you've learned and tune in next time for another foray into the fascinating world of Eosy Text Professional.

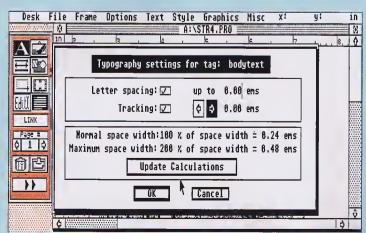

It's a good idea to preserve a picture's aspect ratio, even if the resolution is compromised.

ideal world, all pictures would be scaled to printer resolution and kept at exactly that size. Obviously, that's not possible all of the time, but that shouldn't stop you sizing to printer resolution as a basis for adjustments.

Remember that Eosy Text Pro always uses as much information from a bitmapped picture as possible. For example, if you import a 150dpi (dot per inch) picture, it will be reduced to 90dpi for display on the screen, but will print at full

All tagging operations are carried out through this dialogue box – make sure you've got the right tag highlighted!

The spacing between characters can be adjusted through the typography dialogue box.

ot that long ago, printers were seen as a luxury as far as home computers were concerned but these days it's hard to imagine not owning one. There are three main technologies you can go for, each with pros and cons, but the right choice depends on exactly what you intend to do with your ST.

- Dot matrix. The cheapest printers are generally dot matrix designs which work by hammering ink from a ribbon onto the paper and so can be rather noisy. The sheer simplicity makes them very fast, particularly when printing in draft mode. As for quality, you get what you pay for 24-pin printers offer better quality text and faster output than their 9-pin cousins. Dot matrix printers are ideal for listing lengthy programs or read.me files and fine for light word processing.
- Inkjet. Inkjets have taken over the printing middle ground and are particularly good for home users dabbling in DTP and graphics but still

Buffer: in-built printer memory that speeds up printing on inkjet and dot

matrix designs.

CPS: Characters Per Second, a measure of print speed.

LQ: Letter Quality, the best print quality on a dot matrix. Draft is the worst while NLQ is "Near Letter Quality".

Parallel interface: the standard way to connect a printer to an ST. A serial printer will be much slower – avoid them.

PCL: Hewlett-Packard's Printer Control Language as used in Desklets and most lasers.

PPM: Pages Per Minute, a measure of print speed on laser printers

Resolution: in dots per inch, resolution has a direct bearing on quality. A 9-pin can range from 120 by 72 dpi (draft) to 240 by 144 dpi (best) while a 24-pin goes from 120 by 180 dpi (draft) to 360 by 360 dpi (best), depending on the driver. Most inkjets and lasers are 300 by 300 dpi but the new generation lasers are capable of 600 by 600 dpi.

Sheet feeder: feeds cut (single) sheets one at a time through the printer. A system used on lasers and inkjets but optional on dot matrix printers.

Tractor feed: a mechanism on dot matrix printers for pulling perforated paper through the machine.

BUYING A... PRINTER

With a printer available for virtually every task, how do you select the right one for you? Maurice Collins presents the right questions...

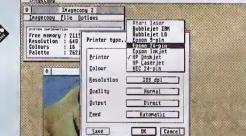

The new generation of HP DeskJets offer 600 dpi resolution in colour with the 560C (left) and mono courtesy of the 520.

needing text output on demand. The output quality isn't as high as a laser but they're cheaper to buy and run, and the noise level is very low. They tend to be slow at printing text though.

• Laser. The price of laser printers has dropped dramatically of late and it is possible to buy a good one for under £500.

Relatively quiet and moderately fast, they produce very high quality

O E

A good printer driver like Imagecopy 3 can be vital.

The Star LC24-200, a classic colour 24-pin dot matrix printer.

With a high resolution, 360dpi output, a bubblejet printer such as the BJ-10sx has a lot to offer for a small outlay.

output but you can face big bills for toner and new drums if you use them a lot. For DTP use, they are ideal but ensure you order one with enough memory – a complex A4 page may need 2Mb or more of internal printer memory.

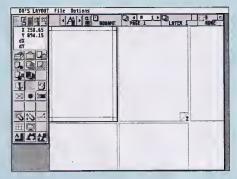

- Running costs. At one end of the scale come the matrix printers which use cheap, long-lasting ribbons while at the other end come lasers with £150 replacement drums and expensive toner cartridges. The media type is also important - all printers can use plain paper but some really need special paper if they're to produce their best. Some types of inkjet paper can cost £1 a sheet, so check this out. You can save money by re-inking your dot matrix ribbons (not recommended) or refilling inkjet cartridges rather than replacing them (worth a try but messy).
- Colour. Colour dot matrix models cost little more than their mono equivalents and are still very cheap to run, but colour inkjets are more expensive to buy and run. In fact, it can work out at well over £1 a page to print pictures on a colour inkjet, even on plain paper.
- Compatibility. This is crucial. Most ST programs need to convert your on-screen creations into a form your printer can understand. To do so it uses what are called "drivers", tiny programs that translate the program's output. No software can include drivers for every printer but there are some standards that most printers emulate, so pick a printer with an emulation mode that your software can handle.

Most 9-pin dot matrix printers emulate the Epson FX80 or IBM Proprinter and most ST programs have a driver for one or the other of these. Moving up, 24-pin models have a wider range of emulations but the most common is probably Epson LQ850 (LQ870 for colour). The inkjet standard is the DeskJet, which many now emulate, though the Canon Bubblejet is also popular. The laser standard is the HP LaserJet in several guises. If your printer is compatible with any of these, you shouldn't have much trouble getting it to work properly.

What is a page?
Günter Minnerup
continues his
series on good
DTP design with a
look at page sizes
and margins...

ast month, the importance of white space for good page design was stressed: or, more precisely, of the correct balance between white space and printed areas. The starting point for all such considerations, of course, must be the "real estate" actually available to you – the size of the page.

We're all familiar with the standard A4 and A5 sheets as used in letters, and all DTP software offers these sizes, but even a cursory glance at your bookshelf will tell you that these sizes are almost never used for books. Magazines, too, will often be slightly larger or smaller than A4, not to mention promotional leaflets, business cards and invoices. Commercial printers use sheets much larger than A4, and economic considerations often dictate page sizes that fit the printing machine with a minimum of

Crop marks give a visual indication of the trimmed page size you are working with and serve as guides for the guillotine.

visualise the available design area on screen. For book work, the so-called "golden section" or "golden rectangle" is supposed to describe the most visually pleasing page dimensions: at a ratio of 8.1:5, this is narrower than an A4 or A5 page and would make a good starting point if you are really unsure where to draw the line.

class! The printed area will often be made up of several columns, most obvi-ously in newspapers and magazines but also in business stationery and promotional leaflets. The number and width of such columns will be the subject of next month's article, and for the time being we will consider the printed area as one rectangle. That still leaves the issue, however, of whether the left and right margins should be equal. Symmetrical page design with equal margins on either side is the more conventional approach and has the advantage of being handled more easily by the beginner. In DTP terms, it also makes it easier to switch pages around within a document you only need one master page rather than different ones for left and right hand pages. The drawback is that symmetrical page design can look rather staid and boring.

Asymmetrical design, by contrast, introduces an element of tension which can bring pages to life and offer much greater scope for creative design. The debate between the two camps has raged for many decades now - and I must admit to being heavily biased towards the asymmetrical school of thought. Yet I hesitate to recommend it to the absolute beginner as it is much easier to learn the basics with a strictly symmetrical approach as this seems to be more in tune with our natural inclination towards order and balance.

Most commonly, asymmetrical page design has wider outside than inside margins: the extra wide space looks luxurious and can be used for illustrations, folios (page numbers), headers, footers or even footnotes. In a DTP context, however, it requires very accurate planning as the simple insertion of just one page into an existing document can lead to all kinds of problems! (tell me about it... Art fd)

BETTER BY DESIGN

waste. "Imposition" is the name given to the arrangement of page items on the physical sheet of paper going through the printing machine, and you would follow the same principles when arranging multiple business cards on your A4 laser or inkjet printer. So when we talk of the page size, we are referring to what the trade calls the "trimmed" size after the items have been separated and any waste trimmed off.

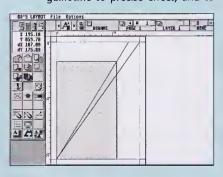

Unless you are simply designing a letterhead or anything else intended to be of exact A4 proportions, it is a good idea to follow the established convention of marking the trimmed page size with crop marks. Even with business cards on a laser printer, such crop marks will help you use the quillotine to precise effect, and to

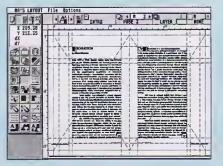

MARGINAL CONCERN

The main white space on a page is the margins around the printed area. As with the "golden rectangle", traditional concepts of elegance have been largely derived from the beauty of medieval manuscripts and prescribe a rather generous arrangement where the bottom margin is twice the size of the top margin and equal to the combined size of the left and right side margins.

In our more cost-conscious (and ecological) modern times, this is considered a bit wasteful and narrower margins – especially bottom margins – are the rule. Do what looks good to you, but keep in mind the general rule that means margins suggest cost-cutting and "luxury" margins,

A page defined by the proportions of the so-called "golden section" superimposed on A5. You will find that most paperbacks are trimmed very close to these dimensions.

Asymmetrical page layout looks livelier and offers a wide marginal design space that could be used for illustrations or footnotes.

TRUE TO Type

This month Andrew Wright looks at the first considerations when choosing a font for your document...

a document, you should devote some time to planning the way it will look and feel. The look of a document is its overall size and shape, the width of the margins and so on. You can think of the look of a document as the scientific side of DTP – follow the rules and you'll rarely go wrong. The way a newsletter or a report feels is something else again and this is a chance for the artistic side to come shining through.

The most important input in terms of feel is often the typefaces that have been chosen and used. A document can look very modern and high tech, distinctly ovont gorde or staid and classical, depending on the typeface you choose. Further on in this piece, I've set out a simple classification of typefaces so you can immediately catalogue your collection, either mentally or on paper. Clearly, for most DTP work, the most important fonts will be those capable of being used as body text – in other words, serif typefaces.

However, the first thing to think about when planning a typeface for a document like a newsletter is not whether you actually have it (although that is clearly important!) but whether it will stand up to the task. Is it a commercial quality font or

is it one with a more dubious origin? Most shareware and PD fonts tend to be display or script typefaces, unsuitable for page after page of body text. Others that do appear to be suitable at first glance may have a number of hidden faults that will soon come to light when used. Print out a full page of text in each typeface and look for irregularities. For example, one character might not sit quite correctly on the baseline or there may be a large gap between two particular characters.

Another problem that often comes to light after you've laid out half of the document is the lack of vital characters! It's no good opting to lay out your maths thesis in a font that doesn't have mathematical symbols or your French short story in one that lacks characters with the correct accents. As always, it pays to think ahead.

BY TYPE

It's virtually impossible to classify every single typeface in existence but the following guide should help.

• Serif: Serif typefaces like Times/ Dutch are widely used for body text as they are generally acknowledged as being the easiest to read. They are

Sans Serif

Swiss, better known as Helvetica, is a classic sans serif face...

Castleton Roman

... while this
Castleton Roman

club's GDOS
Fontpac series.

easily identified by the tiny serifs on the ends of the strokes and include the Speedo typefaces Dutch 801 and Bitstream Charter, Serif in Timeworks 2 and Garamond Antiqua in Pogestreom.

• Sans Serif: In contrast, sans serif fonts have no serifs at all. This makes them plain and simple and explains also be used as body text in short documents. The *Timeworks* font Rockface is a good example.

• **Script:** Script typefaces are an exaggerated form of lettering that can often be joined in imitation of handwriting. They are best reserved for things like menus and invitations and should never be used as body

Slab serif

Geometric Slabserif can be used for short passages of body text.

why they are often used for headlines and posters. They can be used for body text, of course, and can give a bright, modern appearance like the pages of *ST Review*. Well known examples are the numerous variations of Swiss/Helvetica found in most programs and PD ones such as Futura from the FaST Club's collection.

• **Slab Serif:** Slab serif typefaces deserve a class of their own as they generally fall between serif and sans serif in terms of readability. They serve well as headings and crossheadings but the lighter varieties can

text because they are hard to read except in short phrases. Examples include the Park Avenue font supplied with *SpeedoGDOS* and Sage from *Timeworks 2*.

• **Display**: In many ways, the category of Display fonts includes the ones you can't squeeze in anywhere else. They are generally useless for body text and tend to be far too fancy for cross headings, making them best kept for attentiongrabbing headlines and titles. Examples include Drury Lane Capitals from *Timeworks* and Cooper Black from the Speedo collection.

BOUTIQUE
WILD WEST

Display fonts come in all shapes and sizes..!

> Brushwood from Timeworks 2 is a reasonably legible script face but beware of using it as body text.

Brushwood ABCDEFG abcdedf g

JUST THE JOB

If you want to emerge from a mail merge operation with your sanity intact, follow Richard Williams' quick guide...

ail Merge – the very words are enough to make sole-trader mail order business people cry! In fact, many of you may be inclined to trade your soul for the ability to make mail merge work properly every time. Why can the mere mention of mail merge turn those with even a little knowledge of it into asylum cases? Ah, yes – the answer is in the question itself. A little knowledge...

Know your enemy is one of the most sensible elements of battle strategy. So it's time to acquaint ourselves fully with the word processor/database user's enemy numero uno.

What is mail merge? Well it's supposed to be a marvellous means of automating the process of sending the same letter to many people. But some people don't find it marvellous at all. After it's fallen over for the twentieth time, it's back to editing the letter and printing each one individually.

Know your enemy – so here's your battle brief:

- First ask yourself if you really need to use mail merge. If you're sending a note to half a dozen suppliers and it's very much a one-off exercise, it could be a major waste of time.
- Plan meticulously. Winning this first campaign will set you up for victory in many more to come.
- Many word processors can handle mail merge entirely on their own as they allow you to create both the name and address file and the letter file, then merge the two elements to produce your mail drop. But data entry can be tiresome as you have to enter a delimiter (often a comma) between each "field" or element of the name and address. Typing names into a database is much easier, but you need to be able to save the database file as ASCII (unformatted) text with commas or some other delimiter between the names in the fields. Fortunately, many databases can do this - but then your word processor

needs to be able to read such a file to make use of this data!

- When you have created a name and address file, make sure you keep it updated.
- Keep at least the last mail merge letter you wrote, complete with the holders for the fields to be inserted at the top. This means you can edit the letter to send out a new message, but never have to remember how to type in the holders again.
- Get a sheet feeder for your printer. Having to pause between pages to place a new sheet in the machine is seriously bad news.

BY EXAMPLE

And now, the practical bit. Using Compo's excellent *That's Write* as our example word processor, here's one way of doing it.

Create a new file and type all your names and addresses into it, placing each one on its own line and with a comma as a delimiter, like this:

Mr,Richard,Williams,
"1, Asylum Street",Newport,
Isle of Wight

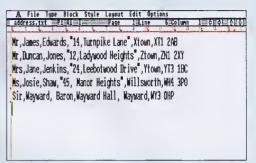

Mr, John, Major,
"10, Downing Street",
Westminster, London

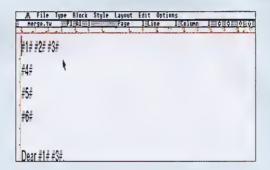

Don't hit <Return> and break a line – make the line wider if it doesn't fit. The quotes around the number and street part of the address tell the program to ignore the address comma for field separator purposes.

Each name and address must have the same number of fields. If, for instance, you did not know Mr. Major's first name, you must indicate that it is missing by placing two commas next to each other like this:

Mr,,Major

Creating the addresses file.
Type your addresses like this – and make sure you save the file...

In your merge letter, type in the field numbers. Each number is preceded and followed by a hash, and there's a space in between.

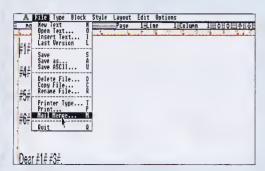

Save the address file as ASCII. For the merge letter, create a new file and write your own message but between your own business name and address and the message, be sure to follow this format for the recipient's name, address and "Dear..." bits:

#1# #2# #3# #4# #5# #6#

Dear #1# #3#,

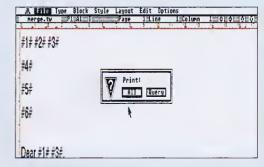

Now, with your merge letter onscreen and your printer connected and switched on, choose Mail Merge from the File menu. A dialogue box will appear, asking you for the name of the address file you wish to use. Hunt through your files and find it, double-click and you should be rewarded with another dialogue box asking if you want to print All (a copy of the letter for every address) or Query the list. Choose the latter and you can view each letter on-screen before it prints.

And that's it. Once you are the master of mail merge, and you've saved your first successful effort, you will never look back. Life gets less tedious then for the person whose success depends on sending the same thing to lots of people. And isn't that what much of business is all about? Yes, those who master mail merge will see in microcosm the meaning of... (We stopped Richord here ond switched off both his ST and printer, which hod just produced 10,000 copies of this orticle, every one addressed to Mr. Major... Ed)

Choose Mail merge from the File menu, and you'll be asked which file you wish to use as the address list.

Do you want to print copies for all names and addresses, or query the list? For query, you'll be shown each address and can answer "yes" or "no" in each case.

JR KITS for MONO

Ever wished you'd bought a colour printer instead of a mono one? Wouldn't it be nice to print out pictures in colour? Now you can with Atan "FlexiKolor Kit". Each Atari FlexiKolor kit comes complete with everything you need to print in colour, including superb software. The colour kit is simple to use, the ribbons fit exactly the same way as your black ribbons so it will not affect your guarantee. Also on all models listed below paper alignment is automatic, you do not have to manually align. PRINTS AS GOOD AS COLOUR PRINTER. If your printer is not listed below please phone. Atari FlexiKolor kits for Star LC10, LC20, all Star 24 Pin. Panasonic 1080/81/1123/1124. Epson FX80, LQ100, LQ400, LQ800 etc. Citizen 120D+, NEC P6, P6+, Seikosha 1900+. Please note colour kits come complete with coloured ribbons and software. COMPLETE KIT £39.95

THE COLOUR SOFTWARE FOR YOUR COLOUR PRINTER

NO MORE BANDING! NO MORE WHITE LINES!

Yes it's true the new Plus 3 will remove banding and white lines from dot matrix & bubblejet printers. Now you can have deskjet quality on dot matrix and bubblejet printers.

- * Balance control for picture enhancement
- ★ Select area to be printed
- ★ Select size to be printed
- * Page control
- * Colour sieve
- ★ Ink correction
- * Automatic poster mode for larger than A4
- ★ Gamma correction (fully adjustable and saveable)
 ★ Spooler for colour letterheads etc
- ★ Imports a large range of file types including (IMG) larger than screen size, tiny, Spectrum 512, IFF, Degas, Neo, IFF (Amiga), HAM (Amiga) yes you can even print Amiga pics.
- Colour separation (Print colour on your Bubblejet/Deskjet)

- Ideal for T-shirt printing
 Now with anti-aliasing, to get rid of those jagged edges
 Large range of dithering (dot pattern) modes
 Run in any resolution, view, manipulate and print in any other resolution
- ★ Colour catalogue function will print a miniature of each picture configurable between 1 to 8 across
- ★ Will drive 9 or 24 pin 5tar, Citizen Swift, Panasonic, NEC, Epson, Canon, HP Deskjet 500C, 550C, Laserjet, Seikosha etc

OPEN WIDE

Ofir Gal continues his exploration of the AES window messages...

hat happens when a user clicks on the *full box* in the top right-hand corner of a window? The size of the window is maximised and while this is quite easy to implement, there are several steps that you need to take in order to correctly support this feature of GEM.

First you have to obtain the maximum possible size of the window, a constraint of the screen. Do not assume that it is always 640 by 400 pixels! All STs support three screen resolutions and some users will have overscan or a graphics cards installed. There are also the TT and Falcon to consider; the latter can produce a variety of screen resolutions. You can safely assume that the screen mode will not change while the program is running, so you only need to find it once, typically at the beginning of your program.

This is achieved with the help of FNwind_get which is called with the window handle 0 and the function code WF_FULLXYWH. This returns the maximum size of window 0. If you are wondering where window 0 comes from, read the Windaw IDs and Handles box. The program line below is all you need to obtain the maximum size of your windows; the code places the maximum values in

the variables maxx, maxy, maxw and maxh:

junk=FNwind_get(0,WF_FULLXYWH,maxx,maxy,maxw,maxh)

When the user clicks on the full box, the AES sends your application a WM_FULLED message with the window handle in mess(3). The subroutine WinMessage requires a new entry for WM_FULLED which should call the sub-routine WindowFull, passing it the window handle as found in mess(3). The code in listing 1 demonstrates this.

BACK AGAIN

The full box acts as a two-way switch, maximising the window first time and returning it to its original size and position. This is not difficult to implement and is a very useful feature of GEM. The sub-routine WindawFulled has to change, making use of another FNwind_get variety, namely WF PREVXYWH which returns the previous dimensions of the window. It should first check the current size of the window – if this is already the maximum possible size it should call FNwind_get with the code WF_PREVXYWH and then set the window dimensions to the values

```
LISTING 2

END SELECT
END SUB
```

returned by the call. The source code is simpler than the explanation (*thank goodness far that... Ed*) and is shown in listing 2.

THE TOPPING

One other window message needs to be looked at here – WM_TOPPED, sent whenever the user clicks on a background window. Your window can end up in the background if your application uses more than one window or if another application or desk accessory opened a window on top of yours. When a WM_TOPPED

message is received the window handle is placed in *mess(3)* as usual. The response is to call *FNwind_set* with the function code *WF_TOP*. This is shown in listing 3. The standard x, y, w and h parameters in the call are of no consequence and you can simply pass zeros instead.

It is interesting to note that in most cases, topping a window requires a screen redraw because parts of the window may have been obscured and are now visible again. The AES is clever enough to detect this and will also issue a WM_REDRAW message if necessary.

```

```

GEM MOUSE FORMS

Constant	Value	Meaning
ARROW	0	Arrow
TEXT_CRSR	1	Vertical bar
BUSYBEE	2	Busy bee
POINT_HAND	3	Pointing finger
FLAT_HAND	4	Extended fingers
THIN_CROSS	5	Thin cross hair
THICK_CROSS	6	Thick cross hair
OUTLN_CROSS	7	Outline cross hair
USER_DEF	255	User defined*
M_OFF	256	Hide mouse
M_ON	257	Show mouse

*The user defined option should not be used without defining the form first. The form structure is documented in the HiSoft BASIC manual as well as most GEM programming books.

The program code here will handle such multiple messages without any problems.

MOUSE DROPPINGS!

Although our program appears to work flawlessly, it suffers from a fundamental problem which I have avoided until now. Click on the full box and then move the mouse – a mess gets left behind, fondly known as "mouse droppings" among GEM programmers!

How do you solve this? The GEM programming guidelines require you to use two AES calls before and after drawing to the screen: FNwind_updote and graf_mouse. The first tells GEM that you are about to do some drawing and locks the system so that no other programs are able to draw. The second hides the mouse, preventing the so-called "mouse droppings". On finishing the drawing, you must call these again in reverse order, effectively displaying the mouse and then releasing the screen.

The call FNwind_updote takes a single parameter, a flag telling the AES whether you are about to draw

or have just finished. The value 1 is used to start drawing and 0 to end it. However, it is much better to use the constants BEG_CNTRL and END_CNTRL to do the same.

grof_mouse takes two parameters, but only the first is important for our purposes. It is best to use constant names rather than explicit values with this call. In addition to being able to hide the mouse, grof_mouse is also used to change its shape from the standard arrow to one of seven optional shapes. The GEM Mouse Forms table lists the various mouse forms available under GEM; the fixed code is shown in listing 4.

The full program along with the file AES.BH which contains the various constants used by the program can be found on the cover disk. Next month I will continue this tutorial by adding a menu bar and other functions to the program.

SPLIT LISTING

As a final point, when writing GEM applications, the use of complex sub-routines and functions means that lines of code can be very long. However, it is possible to break a line

MISSED THE FEBRUARY ISSUE
COVER DISK WITH
K-RESOURCE?
No problem – just
turn to page 98
for information

of code into two. Take the following line for instance:

on how to order

back issues.

IF very_long_variable=2 AND
another_long_variable=4 THEN

Treating it as a single, continuous line of code, it can be written as:

IF very_long_variable=2 AND _
another_long_variable=4 THEN

The space and underscore at the end of the line are used to indicate this to the compiler. Note, though, that you cannot break a long text string into two lines...

```
LISTING 4
DO
  evnt_mesag VARPTR(mess(0))
  junk=wind_update(BEG_CNTRL)
                                   'take over the screen
  graf_mouse M_OFF,O
                                   'hide mouse
  IF mess(0)>=WM_REDRAW and mess(0)<=WM_MOVED THEN
     CALL WinMessage
                                   'handle message
  END IF
  graf_mouse M_ON,O
                                   'reveal mouse
  junk=wind_update(BEG_CNTRL)
                                   'release screen control
LOOP UNTIL mess(0)=WM_CLOSED
```

NEW COMMANDS

grof_mouse: used to change the mouse shape or hide it. It takes two parameters: the mouse shape and a pointer to a user-defined mouse form. wind_update: an AES function used to block or release the screen. When used to block the screen, no menus can be pulled down and other applications or desk accessories must wait until the screen is released.

WINDOW IDS & HANDLES

In most cases, BASIC makes the life of the programmer much easier, but on occasions it adds a layer of complexity to programming, especially when it comes to the AES. This is the case with window IDs and handles.

BASIC window commands use an ID that is determined by the programmer when calling the WINDOW OPEN statement. You may specify an ID ranging from 0 to 7 inclusive.

The AES gives each window you open its own handle which is effectively the AES window ID. This ID is determined by the AES and depends on the number of windows currently open. Normally, ID 0 is taken up by the desktop.

As a rule, always use the BASIC ID when using the WINDOW statements and the AES handle when calling any of the FNwind_ AES functions. BASIC provides a command that allows you to convert from one to the other if required.

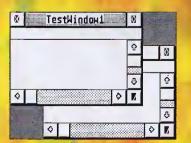

Use WINDOW READ id,5,result to find the AES handle of the window which is then placed in the variable result. WINDOW READ hondle,6,result can be used to find the BASIC ID of a window.

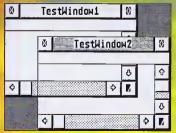

STEP BY STEP GUIDE

WINDOW TOPPING

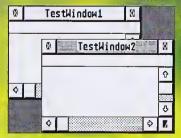

See what happens when you click in the window entitled "TestWIndow2", a part of which is hidden behind the "TestWindow1"...

The computer's AES sends a WM_TOPPED message to your program when you click on the bottom window with the window's handle in mess(3).

Respond to the message with a WF_TOP command.
The AES puts the window at the top of the window stack, redrawing only its gadgets.

The AES then sends a WM_REDRAW message upon which your application must redraw the newly revealed part of the window.

WELL SORTED ...

he last C tutorial ended with a gristly function declaration for you to chew on:

void qsort(void *base,int n,
int size,int (* compare)
(void *,void *));

This is the declaration for the ANSI standard library function qsort() which sorts an array using the Quicksort algorithm. As the name implies, Quicksort is generally a much faster technique than the dismal bubble sort which seems to turn up in many books on programming.

The real beauty of qsort() lies in the flexibility offered by the programming interface. Arrays of any kind of object can be sorted according to any rule you like. Even better, the fiddly details of the algorithm are squirrelled away in the library, making programming simple.

Returning to the function declaration, it should have been clear that qsort() expects four arguments: base, n, size and compare. The middle two arguments are simply integers, specifying the number of

What is the most efficient way to put items in order? Jon Ellis figures it out...

elements in the array and the size of each element in bytes. "base" is a pointer to the start of the array, typed as a void pointer, void *, because qsort() does not know (or indeed care) what items it is sorting. Void pointers were introduced in the issue 29 C tutorial, if you need to refresh your memory!

These three arguments give qsort() enough information to be able to shuffle elements around within any array. The final one allows it to know which elements are out of order. "compare" is a pointer to a function that returns an integer, and takes two pointer arguments as input. Where does this function come from? You have to write it, because only you know how to compare whatever data may be in the array.

At each stage in the sort, qsort() calls the "compare" function to find out whether or not to swap two elements. The two inputs are pointers to array elements that qsort() would

like compared. The function returns a negative number if the first array element should rank below the second, 0 if they are equal, and a positive number if the first element comes before the second. Once again, void pointers are used to allow qsort() to retain its ignorance about the array element type.

ORDER, ORDER

As usual, this looks dreadfully complicated in writing but is much easier in use. To demonstrate qsort(), let's develop a program that reads in a text file, sorts it and then lists out the sorted lines. To make life awkward, we will strip out any blank lines as we go, and also remove any leading tabs or spaces at the start of lines. There is a good reason for doing this: spaces rank before any alphabetic characters in the ASCII table, so create a rather unexpected, though entirely logical, output file.

The program, QSORT, is based loosely on the code developed for UCPRINT. The full source code is in the tutorial folder on the cover disk, but we will review some of the more important features here. The first task of the program is to read in its input file using a short while loop as in listing 1.

Lines are read into a temporary buffer (with the exciting name "buffer"). A generous over-estimate of the likely length of one line of text is used to make sure the buffer is big enough to cope with most eventualities. The next task is to scan through the line, and strip out any leading spaces. This is done neatly by making use of the power of the for loop. So far we have mostly used these loops for numerical counters, just like a normal BASIC FOR-NEXT loop. For more information, read the For What It's Worth box.

The for loop starts by making the pointer "s" address the start of the line buffer. It then moves the pointer along, checking each character to see if it is the end of string null (if so, *s will evaluate to zero and the loop will exit) and if the character is white

```
Listing 1
while (fgets(buffer,BUFFER_SIZE,infp) != NULL)
{
  if (saved >= MAX_STRINGS)
    terminate("Too many lines !\n");
  for (s=buffer; *s && isspace(*s); s++)
    continue;
  if (*s == '\0')
    {
      discarded++;
      continue;
    }
  if ((string_array[saved++] = strdup(s)) == NULL)
      terminate("Run out of memory while reading data !\n");
}
```

```
Listing 2

int sort_strings(element_1,element_2)

void *element_1, *element_2;

{
   char **s1, **s2;

   s1 = (char **)element_1;
   s2 = (char **)element_2;
   return(strcmp(*s1,*s2));
```

FOR WHAT IT'S WORTH

To think of the C **for** statement as being in any way related to *FOR-NEXT* in BASIC is actually wrong. While it *can* do the same job, as a program control statement it is structurally very different. Let's look at a general **for** loop:

```
for (expression1; expression2; expression3)
     {
      do_stuff();
    }
}
```

expression1 is evaluated before the loop starts, so is often used to initialise a count variable. expression2 is evaluated before each pass round the loop; the loop ends if the result is zero. expression3 is evaluated at the end of each pass, so is often used to increment loop counters. The key difference between **for** and *FOR-NEXT* is that the three expressions don't have to process numbers – they don't even have to be related to each other in any way. Of course, most of the time they are, because that is how most programmers think. Despite this, the following would be perfectly good C:

```
for (today=MONDAY; cup_of_tea!=COLD; strcpy(buffer,"Acid"))
  stand_on_head();
```

Bizarre? Yes, but legal! If you have difficulty getting away from the FOR-NEXT idea, think of a for loop as being identical to the following code:

Now do you think all a for loop can do is count from 1 to 10?

QSORT in action on its own source file. The red text is the input file, the green is from the output file.

space or not (if not, again the loop is exited). Once the loop is finished, s is left pointing at the null or at the first non-space character.

These two outcomes are checked, and appropriate action taken. If the loop ends with s pointing at a null, the line had no non-space on it, and is therefore discarded. Otherwise, the ANSI standard library function strdup() is used to take a copy of the text, from the position of s up to the end of the string. strdup() returns a pointer to the copy, or NULL if there is not enough memory to make one. If strdup() succeeds, the address of the copy is stored in the global variable "string_array". The variable "saved" counts the number of lines saved in this way, and indicates which element of "string_array" is to be used next. If the count exceeds the size of the array, the program aborts.

When all lines have been read in, they are sorted into order using qsort(). Because of the way we have stored the data, sorting is quick. We never actually move the lines of text around in memory, we just shuffle the order in which we will read them out, by moving the positions of the string pointers stored within our array. The comparison function passed to qsort() for this task is very short (see listing 2).

Remember that the inputs to the function are pointers to elements of the array being sorted. These are supplied as pointers to void, so our first job is to convert them back to their real type. In our array, the elements are themselves pointers to characters, so the inputs are pointers to pointers to chars. To impose the right type, we use a cast (see issue 29): (char **). To make the code easier to follow, the recast pointers have been assigned to new temporary variables, s1 and s2. To go from pointers to array elements, to the array elements themselves, we just apply the indirection operator *, and the final result is a pair of pointers to strings, just perfect for feeding to strcmp(). Oh look strcmp()'s return value is just the right format for qsort() to accept. What a coincidence... (yep - Houdini would have been proud of that... Ed).

CONTROLLED EXIT

In the last tutorial, we ended with a challenge to rewrite the *UCPRINT* program, using the atexit() library function. The program fragment in listing 3 shows how you might do this. The complete file appears in the *C.TUT* folder on the cover disk as *ATEXIT.C.*

The key design feature of the listing is the presence of the global variable "exit_message". This is because we want the program to print a message describing the reason for termination. There are a number of possible reasons, so we need to vary the message printed. Since the function called by atexit() receives no arguments, we must find another way to tell it what message to print. The program gets around the problem by putting a pointer to the required text in "exit_message" before using exit().

This approach has another useful property. A special value like NULL can be used to instruct the atexit() routine to behave differently, in this case to act like it was not there. Such code is the only easy way to turn off atexit() routines, as the ANSI library does not provide a mechanism for deinstalling them.

In such a simple program as UCPRINT, atexit() does not simplify the code at all, and you probably would not want to use it. However, in more complex programs, particularly those using GEM, atexit() becomes a real boon. Take a look at ATEXIT2.C on the cover disk. This is an atexit() routine that handles the closing down of AES and VDI resources to safely terminate a GEM application. With this routine set in place by an atexit(close_gem) call during program initialisation, you can terminate the program cleanly anywhere just by calling exit(). No more crashes due to unclosed VDI

Each of the various components of the routine checks a series

```
Listing 3
int main(int,char*[]);
void exit_routine(void);
** Global variables...
char *exit_message = NULL;
** The program starts here...
int main(argc, argv)
int argc;
char *argv[];
  FILE *infp, *prfp;
  int c;
  atexit(exit_routine);
  if (argc != 2)
     exit_message = "Usage: ucprint <filename>\n\n";
     return(EXIT_FAILURE);
void exit_routine(void)
  if (exit_message == NULL)
     return;
  puts(exit_message);
  printf("Press RETURN to exit: ");
  getchar();
```

of global variable flags that indicate whether particular system resources have been used. If so, appropriate shut-down code is executed.

Obviously this approach requires that the flags are kept up to date at all times. By way of maintaining this discipline, the routine updates the flags as it works, even though the program is just about to exit. If this seems like a waste of code to you, think again. Defensive programming of this kind, ensuring internal consistency at all times, is well worth a few extra bytes for the time and effort it can save during debugging and maintaining software. Spend a moment considering the alternative...

Graeme Rutt and Mark Baines browse around the Internet's equivalent of the telephone directory...

ast month, we had a look at electronic mail, the Internet's postal and telephone service. But what happens if you want to get in touch with someone whose 'net handle and address you don't know?

If you wanted to find someone's telephone number you'd reach for a telephone directory and look them up. While you can find anyone in your local area through your telephone book, you have to call directory enquiries if they live elsewhere.

The situation on the *Internet* is pretty similar, with a couple of further twists. Firstly, people are much more fluid: accounts are made and destroyed in minutes and people may well have any number of accounts, some of which may be used regularly and others not at all. Secondly, there are concerns over secrecy and privacy to bear in mind.

A person's handle is usually the first part of their login sequence and there are fears that this could lead to breaches in security. Privacy is also a difficult issue. On such a large system as the *Internet*, it's very difficult to ask each and every user if they want to be ex-directory!

So with these difficulties in mind, it's time to look at how to go about searching for somebody on the 'net. There are several services to look at, and which one is best depends on

THE SEARCH IS ON!

the amount of information you know about the person – and a degree of *luck*. All the services we're going to look at are available to both CIX and Demon users.

ONE FINGERED

The most simple service is finger, but you must know either their handle, last or first name, and the host. Finger returns all of these details and also a small amount of text the user may have set up to be displayed. To use this service, get to the ip> or NET> prompt (on CIX and Demon respectively) and type in finger name@host, where name is a handle, first or last name and host is

Logging into the whois server at rs.internic.net.

INTO THE

a valid host site. Whois is a slightly more complex service, offering you the chance to search a directory for people across different systems. There are actually two "whois" directories, one for military sites (nic.ddn.mil) and the other for non-military (rc.internic.net). While you are free to telnet to either of these, you are advised to use telnet ds.internic.net which will look through both. Once on-line, type whois and then any portion of the name or handle of the person you're looking for. Use a full stop to denote

Terminal Setup Risc **** 88:18:45 **85.92 / 88.69 DR

The Knowbot Information Service at Reston, probably the best non-e-mail choice as it uses all the other white pages' directories!

That said, no luck searching for Ofir Gal. It's a good job I know his e-mail address anyway!

Netfind - maybe you'll have more luck than me with this temperamental service.

a partial search. For example, **rutt** would find any whole name "rutt", while **rutt**. would find "rutt", "rutter", "rutther" and so on. The e-mail search service at MIT is, for many users, the best way of finding someone's complete addresses. The server has built up a large directory by scanning Usenet messages and will return information (via e-mail) on all matches it finds.

To use this system, send an e-mail to mail server@rtfm.mit.edu with no subject and send usenet-addresses/name as the body text. name should be any whole handle, first or last name.

LAST TRY

Finally, let's consider a Netfind server. This is a relatively new service which isn't based on any kind of static directory. Instead, this very impolite program tries to interrogate any site it can find within the limits that you pass to it. Connect with telnet monolith.cc.ic.ac.uk and a user name of netfind. Hit <2> to search. Type in a line like name hint hint hint, where name is part of a handle or real name and hint can be anything – country, organisation type, company name or the like. Netfind isn't a very good service at the moment, but it may come up trumps if all else has failed!

That's it for this month. Next issue we're back with some more *Internet* secrets. And remember, if you can't find someone to talk to then chat to someone at random.

You'll feel better for it, so will they and "wrong numbers" are rarely treated with the same ill humour as on the telephone!

sending e-mail to someone is easy if you know their address and have the appropriate software. However, unless that person gives you their address you are lost, just as you would be trying to send a letter without a postal address.

Contrary to popular belief there isn't an address directory or "white pages" containing all the addresses of everyone on the *Internet*. How could there be? The current number of people using the 'net stands at over 20 million and this changes by the hour with users coming and going, moving from one computer host to another or accepting multiple accounts. Then there are those that worry about the privacy and security aspects of such a list. If people want to be ex-directory on the 'phone, why not e-mail as well?

There is no single company to maintain a list although individual

BEHIND THE SCENES

you get a list of users currently logged on at that system address. You can use a first name or last name, spelt correctly and in the format likely to be in the user log. "Steve" won't find "Stephen", for instance. host is the computer system you want to enquire — omit

A finger to nasanews displays the latest information file – very useful if you want to know the current status of the shuttle!

companies or educational sites may maintain their own internal staff directories. How would someone publishing such a list know who is on the *Internet* and if they want to be held in a list? What standard would be used to format the data? What data should the list contain? All of these problems are currently being looked into.

METHODS

• Finger: If you know the system that a user is on then you can use the UNIX command finger which examines the user log on that system for their personal name. It will also tell you if that user is currently logged on.

Finger can be useful, but you have to know half of the e-mail address (the system) before using it. The format is finger name@host; the name is optional but if you omit it this and it looks at your local system. Users can install a file called .plan on their system which is displayed whenever someone fingers them. It can pass on biographical information or other contact points to enquirers.

This plan file can also be used to distribute information to callers.

For instance, you can get the latest NASA news by finger nasanews@space.mit.edu. finger @space.mit.edu will tell you who's currently logged on there.

• Whois: This is the name of a white pages directory and the program that accesses it.

The directory was started years ago on the old Arpanet and is maintained by the DDN NIC. It only contains those people who are responsible for the working of the network or doing research.

You can use the whois command

A reply to my whois by e-mail for "kehoe" the author of the famous "Hitchhikers' Guide to the Internet". There he is at cygnus.com.

if your host supports it or telnet to nic.ddn.mil* and use it or e-mail service@nic.ddn.mil with the subject line whois name where name is the person or company you want to trace.

• Usenet User List: This list is maintained by MIT in the States and contains all those people that have posted messages in Usenet news groups that pass through MIT. To use this service, e-mail mail-server@pit-manager.mit.edu with no subject line and the message send usenet-addresses/name where name is your search string. This is a very effective way to get addresses but replies can be slow – up to several days!

• Knowbot: Still in development, the Knowbot Information Service is a new service that searches various sources worldwide for you, including some that are difficult to access directly. Telnet to port 185 at nri.reston.va.us and, at the prompt, type in your search string.

For further information, send an e-mail to mail-server@rtfm.mit.edu containing the message send usenet/news.answers/finding-addresses. You will get the FAQ back: "How to find people's E-mail addresses".

JARGON JOGGER

Arpanet: Internet was started in 1969 by the US
Defense (sic) Advanced Research Projects Agency
(DARPA) as an experiment to see if computers could be
linked together across the country.

DDN NIC: the Defense (sic) Data Network, Network Information Center based at Network Solutions Inc. in the US. A central information distribution service for the Internet.

FAQ: acronym for Frequently Asked Questions, text files containing FAQs and their answers.

Knowbot: from Knowledge and Robot, A network information search device.

MIT: Massachusetts Institute of Technology in the States.

Usenet: world-wide group of systems that exchange messages in the form of news groups. The world's biggest discussion forum.

User log: file list of users with accounts at a particular system.

White pages: American term for the telephone directory. Now applicable to any list of names and addresses.

TECHNOLOGY

B=1195

NATIONAL HALL, OLYMPIA, LONDON JANUARY 11-14 1995

BETT'95 provides you with the perfect opportunity to meet the increasing demands of today's educational environment through the effective use of information technology.

Whatever your role within education, BETT has all you need for every level of IT investment. Whether you're looking for curriculum specific software, exploring the capabilities of CD Rom, upgrading your schools computing networks or deliberating over administration, accounting or timetabling packages, you can benefit from FREE expert advice and guidance.

With a comprehensive programme of over 60 BETT seminars sponsored by Acorn Computers, additional workshops, presentations, dedicated feature areas and more than 280 leading suppliers of educational IT, a visit to BETT provides the ideal INSET opportunity for all members of staff.

Last year nearly 17,000 educationalists benefited from FREE support, guidance and advice. Now it's your chance - Call 081-984 7711 for further information and FREE tickets; dial the Seminar Fax Line on 0336 413714 for full programme and booking details, or complete and return the coupon below.

ASK THE EXPERTS

You set the questions, the ST Review team answers them...

GETTING MY BACK-UP

I have some disks that I would like to make a back-up copy of, mainly magazine cover disks. The problem is that although the

disks work perfectly, any attempt to copy them from the desktop just displays an alert box and returns to the desktop. How can I copy the disks? Is this another one of those TOS bugs I keep hearing about?

S. Keifen, Doncaster

This is not a bug as such, but more of an oversight in the Atari Desktop design. Most cover disks are formatted using programs like FastCopy and Kobold. These programs use extended formatting schemes that allow the magazine to squeeze a few more bytes onto the disk.

This is why you will find a dedicated back-up program on the ST Review cover disk – STRBAKUP.TOS can be used to copy most disks unless they are faulty or copy-protected. There are several programs, both PD and commercial, that can also help you get around this problem. For instance, FastCopy 3 is popular and available from most public domain ilbraries and BBSs. Indeed, almost any copying program will do a better job of copying disks than the desktop! Mike Robinson

BEEP. BEEP!

I hope you can help me. I have a 4Mb MegaSTe with a 52Mb hard disk. Everything seems to work OK but sometimes when I

turn it on, it makes a loud beeping noise as if a key has stuck down. Usually turning it off and on again fixes it. Is there anything wrong? Should I get it repaired and if so can you recommend a good place to get this kind of job done?

Daniei Pearson, Cambridge

Some STs do what you have described if there is a joystick attached when you boot up. The worst offenders are ones with auto-fire buttons that have been left on. These send out a stream of signals to the ST that confuses it when it is first turned on. If this is the case, make sure you unplug any joysticks before turning your MegaSTe on.

if you haven't got a joystick attached, the chances are that your machine is still fine. I have known several Ataris that do what you have described without showing any other ill effects. However, for peace of mind, you could try cailing Atari Workshop on 0181-693 1919 to ask for a quotation to look at your machine. lain Laskey

PC MOVE?

I bought a 520STe in 1990, and have constantly upgraded it since then. The only other thing I bought with it was a Colour

bought with it was a Colour monitor (Philips CM8833 Mk II). This was admittedly mainly for games. As time went on, I started to use it for other things too, such as word processing, and art packages. The need to upgrade the machine was there, so during the past couple of years, I bought myself a 4Mb memory upgrade, a mono hi-res monitor, a colour printer and TOS 2.06. This all seemed fine, but now I find that with my increasing interest in other areas, I need to buy a hard drive, a highdensity floppy drive, and a CD-ROM player. My father has a PC with all of the above, and my ST seems like a toy, compared to his. Should I sell my ST and buy some extra hardware for my father's PC, which I will be

Kari Biinkhorn, Lancashire

Help is at hand, Kari, In the form of a little program called Ghostlink. With this, there is no need to sell your ST as long as your father keeps his PC! This neat little utility allows your ST to use the disk drives from the PC, its floppy drive (double or high-density), the hard disk and any CD-ROM drives attached to it. All that is needed is a null modem cable to connect the Atari and the PC, and to tweak a few settings in the programs provided for the PC and the Atari. Then away you go — and the best thing about it all is that the program is free!

So, you can now load pictures stored on a CD-ROM (connected to a PC) directly into GEMView on your ST. You can copy files from the PC's hard disk to your floppy or hard disk, and vice versa. You are also able to save files to the hard disk. However, you cannot run programs over this link. The program is still in its infancy, and the ability to run programs over the link is planned for a near future release, as well as the ability to use the serial and parallel ports.

Ghostlink v1.02 Is available from good PD libraries and BBSs. If you have problems finding It, just contact CyberSTrider, on 0161-796 5864. Denesh Bhabuta

SEE IT ON CD

I've heard and read a lot about PhotoCD and as an amateur photographer, I'd like to try it out. I

have just upgraded from a 2Mb STe to a 4Mb Falcon with an SVGA monitor. I intend to get a CD-ROM drive, probably from System Solutions as they seem to be leading the field in this area, and a Deskjet 560C or something similar for printed output. What I need to know is, how can I access the PhotoCD images and in what resolutions? I've tried the shareware version of GEMView from your cover disk but it only appears to load base size or one other that I can't work out.

Roy Murphy, Oxon

PhotoCD is Kodak's proprietary system for developing film directly >>

THE ORACLE

It's Andrew Wright's turn to impart five pearls of wisdom – or not, as the case may be!

- If you're spending several hours in front of your computer each week, you've got to be comfortable.

 One of the best ways to pep up your system is to go for a decent monitor. Those of you who are still using portable TVs will be amazed at the difference a good mono monitor makes to any text-based program like a word processor, address database, accounts or DTP package.
- Make sure the monitor is at the right height. The ST's awkward design makes it hard to balance a TV or monitor on the case. With just three bits of wood you can make a handy shelf-style stand to get the monitor up to eye level and give you space when you need it by tucking your ST underneath.
- Improve your keyboard's response and make it much more pleasant to use. You can add rubber buttons under the keys or even purchase a connector to allow you to use a professional PC-style keyboard. Give System Solutions a ring.
- Get rid of that clunky, horrible Atari mouse. A good quality replacement is a must and it won't require half as much space to roam around, thanks to the higher resolution.
- Many of you have probably added a second floppy disk drive to your shopping lists. If you've done so, take it off. It won't make the slightest difference to 99% of your work so put the money towards a hard disk instead.

< in to a compressed digitised image formot stored on on ISO-stondord compoct disc. The *.PCD files on the disc can be occessed using oppropriote software at any one of five resolutions: 192 by 128 (wollet), 384 by 256 (snopshot), 768 by 512 (stondord or bose), 1536 by 1024 (lorge) ond 3072 by 2048 pixels (poster). These images toke up roughly 74Kb, 295Kb, 1.3Mb, 4.7Mb and 18.9Mb respectively, meoning 4Mb Falcons ore limited to 768 by 512 - ond even 14Mb mochines con't load the highest resolution images.

You're quite right in that GEMView can only lood PhotoCD imoges in the bose or snopshot sizes depending on whether or not you tick the PCD: Bose Size box in the Globols diologue box. A more flexible option is Imagecopy 3,

N

presentations and so on at work. **Louise Pitts, Notts**

SyQuest drives come in two moin flavours. The older 5.25 inch drives hove cartridge copacities of either 44Mb or 88Mb while the newer 3.5 inch models hove cartridges of either 105Mb or 270Mb. The most cost-effective model ot present is the 105Mb drive, both in terms of cortridge cost ond initial purchose price but this will reolly depend on the omount of storoge you require.

SCSI SyQuest drives work admirobly with oll Atoris ond the 3.5 inch drives ore olmost os fost os similar-sized hard drives - and just os quiet. The moin odvontoge of o SyQuest drive is that you can transport your dota to another SyQuest-equipped system ond you con keep odding storoge spoce os your needs grow. It is also handy for bocking up existing hord drives. The only reol disodvontoge is thot long-term reliability isn't quite os good as that of o fixed hord disk though the new 3.5 inch drives certoinly look ond feel much hetter

To connect the drive to an STFM you will require a host adapter such os The Link or Tronslotor ond suitoble driver software such as the ICD Utilities thot come with The Link, or the HDDriver utilities thot come with the Translotor. Both can be bought from System Solutions ond they con olso supply the drives themselves.

You con't use on Atoriformotted cortridge with onother
computer, but with HDDriver or
ICD softwore you con reod ond
write to o cortridge formotted on
a PC. Note thot os your Atari can
only use the SCSI SyQuest drives,
the PC will hove to hove o SCSI
host odopter too. There is one
limitotion with PC-formotted
cortridges – the Atori connot reod
lorge DOS portitions over 32Mb in
size. Andrew Wright

PROSPERO PUZZLER

I have been using the *Prospero C* language program since it was issued on your cover disk in September last year. Although it has behaved reasonably well up to now, it did not run a larger program I have recently written, which has run perfectly well on another machine. It appears that when variable arrays are declared which total over about 1,000 double-precision floating point numbers, which would occupy only 8Kb, the program is unable to allocate space to them. The program compiles correctly (eventually) but when it is run, an error message "Error S at 2B44" is returned. I assume that this is a size error and memory is not being allocated. Is this correct?

There is certainly memory available, for if the program is re-written to dynamically allocated memory, enough can be reserved. But if anything has to be re-written, it defeats the objective of having a "universal" language.

I can find no reference to any program limitations in your magazine. Could you please advise me whether the *Prospero C* issued with the September 1993 magazine is limited in some fashion? Or is there some set-up or compiler option I have missed? I would not be in the least surprised if there was a limitation as cover disks are often limited in some way.

J. N. Ellis, Devon

It's really weird answering a question from such o precise nomesoke! The first point to make is that the Prospero C packoge feotured on the cover disk from September lost year is o completely functional, unlimited version of the system. Rest assured that had this not been the cose, you would have been told of the time.

Block

Cancel

Whot you hove encountered is o run-time error. I am sure that you will have encountered mony error messages from the compiler during the course of developing your programs. These are called compile-time errors and occur when the source code breoks the rules that describe the C language. Run-time errors are caused when something happens during the execution of o program that causes the C environment to become unstable. A common example arises from orithmetic code, where o varioble unexpectedly ocquires the value zero, and is then used in a division operation. If the C library is asked to divide by zero, what can it do? There is no sensible onswer it can return, so it flogs o run-time error and stops the program. Most run-time errors are essentially have in the program that have

and stops the program. Most run-time errors are essentially bugs in the program that have been caught by the librory code before they couse o crosh.

The porticulor error you mention, error S, is due to a shortage of stock space. This area is used for all outomotic variables among other things. By default, the Prospero system provides a 4Kb stack, which is only sufficient for small programs. To cure the problem, either make the arrays global or static; or use a linker control file like that shown below to increase the stock size. Type this file in, replacing ANSWER with your filename, and then save it as TEST.LNK. Compile the program as normal, but before linking it, tick the "Using control file" menu option, and select TEST.LNK from the file selector.

For more detoils, wotch out for the C tutoriols on run-time errors, stock hondling and the linker which ore scheduled to appear shortly! Jon Ellis

FAULTY FLOPPY?

I have an Atari 520STFM upgraded to 1Mb, with the original TOS 1.02 on board. The internal drive is double-sided and I use an external drive as well. On three occasions, I've been adding

INSTALL APPLICATION

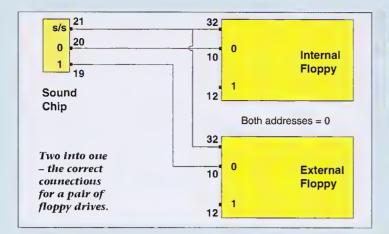

Application name: EVEREST .PRG
Document type: TXT

Boot Status: Auto Normal

Application type:

Dai TOS TOS-takes parameters

Install Remove Cancel

new files to data already stored on disk, via disk drive B. When I've come to re-load the information, the computer tells me that the disk is empty. Not only is the new information not being stored, the previous information is disappearing!

Examining the disk with ST Tool reveals that there are too many clusters while Knife ST says that the files are found after unassigned entries and that they can't be read by the operating system. Is it the drive or the computer at fault?

I don't think I'm overfilling the disks, and the problem hasn't occurred on drive A. The only thing I've discovered is that the second drive was set to drive "0" on its DIP switch. I've now reset this to "1"

Keith Marriott, Crewe

From your description of the problem, there are two foctors that could be cousing data loss.

Due to a poor implementation of the floppy drive circuitry in the ST, the "side select" (s/s) line can become confused when two drives are used (internol ond externol). The side select line coming from the second chip cannot drive the line "low" if both drives hove 1K ohm internal pull-up resistors on the lines. The only cure for this is to locote these resistors and remove them on one drive or both. The problem is that the resistors are usually very small surfocemounted types ond inoccessible.

The other possibility is where you mention moving the drive select to drive "1" ond the drive still apparently working. Most external drives are wired so as to have both drives set at address "0" and to use drive select "0" for the internal and to connect drive select "1" to drive select "0" on the

external drive (see diagram). The drives are selected when the front panel's light comes on. If your drive selects when addressed as both "0" ond "1", then a wiring problem (or on internol ST problem) must be suspected in the external cabling. It could be that you are inadvertently writing to both drives simultaneously – hence your problems!

Paul Rossiter

COLOURFUL CHARACTERS

Help! My Citizen Swift 240C is driving me mad! I've been printing great pictures from dozens of art

programs using an excellent program called *Flexidump*. but can I print in colour from 1st Word Plus 3.2? No! I need to print text in different colours for school (I'm a teacher) but I can't see a way forward. I've tried all the supplied drivers.

Mark Redhill, York

The eosiest way oround this is to create your own custom printer driver. Load an existing printer driver (.HEX file) into 1st Word Plus In "WP Mode". The Epson LQ800 driver is a good bet. Look for the stort of the list of codes (lines without osterisks preceding them) and then go to the lines referring to "NLQ Light". If you do use light text, choose onother rarely used one such as superscript.

In the line thot soys "NLQ Light On", the codes for printing light text are listed as 1B, 78, 0. "NLQ Light Off" is 1B, 78, 1. Now, consult your monual and find the printer commonds for printing in red. For the Citizen Swift the commands ore 1B, 72, 1 – amend

Number crunching – editing a 1st Word Plus .HEX file... in 1st Word Plus!

READERS' HINTS

Win a tenner the easy way – just send a tip to ST Review!

The built-in desktop offers very little in the way of a file viewer. You can view files, but there's no way of scrolling back or searching for a particular word. It is much better to install a file viewer if you have a hard

disk. My personal choice is *Everest* which is really a text editor, but works very well as a viewer because it's simple to use and even uses *GDOS* fonts for display.

The desktop offers a partial solution hidden under the menu item *Install Application*. Here you can assign any file type to a program so that double-clicking on the file automatically launches that program which then loads the file. The problem is that only one file type is allowed. The trick is to edit the *DESKTOP.INF* file with any text editor or word processor – such as *Everest*!

There are two things to watch out for. Some editors, including Everest remove trailing spaces at the end of the line automatically. You must make sure that this option is disabled. Also, when using a word processor such as 1st Word

Good alternative – a file viewer can be installed using the "Install Application" dialogue box from the desktop.

Plus, make sure that you save the file as a pure text, or ASCII, file. Turn WP Mode off in 1st Word Plus.

First make a back-up of your *DESKTOP.INF* file, then install your preferred viewer for .TXT files and save the desktop. Next, load the *DESKTOP.INF* file into a text editor. In it you will find a line similar to the one below:

#G 03 04 D:\EVEREST.PRG@ *.TXT@

Simply repeat this line, changing the file type each time as shown below:

#G 03 04 D:\EVEREST.PRGa *.DOCa #G 03 04 D:\EVEREST.PRGa README.*a

Now clicking on any README or .DOC file will display the file in *Everest* instead of using the desktop viewer. **Colin Caston, Preston**

For a change

- a simple text
editor will let
you hack away
at the desktop
configuration file.

the .HEX file accordingly, soving it under another filename. To turn off the red ink, simply set ink colour to black by inserting 1B, 72, 0 in the line for "NLQ Light Off".

Now, when you've converted this .HEX file into a printer driver, using the INSTALL progrom, ony text you instruct the program to print as light text will octuolly come out as red. Once you've

satisfied yourself of this, you can go bock to the .HEX file and replace the codes for itolic with those for another ink colour like green. You con even use superscript, subscript, underline and bold to get more colours if you need to. Just bear in mind thot you will hove lost the light, italic, superscript ond subscript text ottributes. Andrew Wright

LETTERS

Speak to Vic Lennard, the editor - and receive a £25 cheque for the letter of the month...

STICKY SITUATION

I like your magazine - quite the best of the glossy Atari mags. And the software on the disks is good, too (one of the other mags supplied a program without even informing its author and it didn't do what they said it did).

One small complaint about the cover disks, which has probably not occurred to you. They are firmly secured to the front cover, presumably so that they can't be stolen from a shop's display. But the sticky tape is so strong that I have only been able to get the disks out from my copy at the cost of tearing off some of the cover with the tape. As I keep my back copies, this is unpleasant. It would be good if you could find a way of keeping the security you need without causing the legitimate buyers this problem

Daniel Cohen, London

I would love to say that security is the reason for your difficulty in removing the cover disks, but 'fraid not. About nine issues back, we took the cost-cutting decision not to varnish the cover any more. I feit that the lack of a shiny front to the mag would be better than making savings on the editoriai front. The upshot of this is that the sticky tape adheres far more fiercely to a matt cover.

How about the ST Review Cover Disk Removal Kit? Check out its contents in item 20 on page 38...

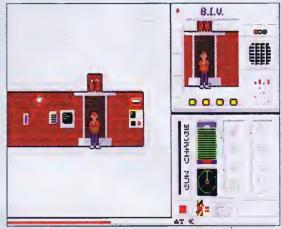

FUN AND GAMES!

Well, well, well - you've finally dragged ST Review into the centre of the market! I refer, of course, to the inclusion of a real games section, even if it has been half-inched from your recently departed sister.

All joking apart, I think issue 33 is one of the best ST Reviews in a long time. I'm one of that dying breed of ST gamesplayers who happens to also use his machine for word processing rather than the other way round. So ST Format has always been my first port of call.

Well I'm convinced. You've waited until we can actually walk into a shop and buy a Jag before reviewing the games - and the piece on Obsession and the Swedish developers just blew

The full story - the H.E.R.O. review in this issue is hased on the full. final UK product...

the opposition's coverage away.

Just one more point before I take out a subscription to your mag. You're going to have to tighten up your act on getting products reviewed first - how come ST Format reviewed H.E.R.O. in the same issue as you previewed it?

John Townsend, London

Thanks for the vote of confidence. We took the best aspects of ST Action, kept our own scorebox system and added the four-page Jagged Edge section to keep you in touch with the best games console on the market.

While not affecting our serious editorial coverage of reviews and features, we're taking the games aspect seriously hence the inclusion of playable versions of Ishar III, Premier Manager 2 and Obsession on our recently-added second cover disk. And there's a couple more corkers in the pipeline!

As for H.E.R.O., all I can say is that ST Review does not take a half-finished game, write about it and call it a "review". When we say that we only review final, UK products, we mean it ...

SPREADING THE LOAD

I am a proud owner of a 1040STe which I will never part with. But although it is an excellent computer, I feel that it is time to move on. So I have decided to stay with Atari (naturally) and buy a Falcon. I will be using the Falcon mainly for Direct-to-Disk recording and to do so I will need a machine with quite a high

specification - 4Mb RAM, 120Mb SCSI hard drive and PowerUp2, all fitted in a nice Tower Case, and a good SVGA colour monitor. This is quite an expensive shopping list, and so I want to get the best deal available. I called Gasteiner as they are a reputable Atari supplier and they gave me a good price - and, by the way, the prices in your magazine are wrong. When I asked them why their prices have dropped so considerably, I was told that they are pulling out of the Atari market and moving into Macs. Does this mean the end of Atari? If companies such as Gasteiner, who have been in the Atari market for several years, are now pulling out this must say something for the recent sales of Atari products. I really do hope that this isn't the case as I cannot think of any other type of computer other than an Atari. So give me an honest answer - do you think that this is the beginning of the end of Atari or am I just getting my knickers in a twist?

Ben Hills, Somerset

All of us have to face the sad fact of life that Atari is no longer supporting our machines. This leaves the suppliers in a dilemma: do they diversify their Atari range in order to appeal to the enthusiasts or branch into other markets as well? System Solutions is a good example of the first of these, introducing new Atari products each month. Gasteiner has taken the second view and, while continuing to support the Atari piatform, have decided to also move into the Apple Mac

TO SAY?

ST Review is your magazine and putting pen to paper gives you direct contact with us. As editor, I read every letter that you send and carefully select the ones for publication. I receive far more letters than can be printed, so make yours interesting if you want to see it in these pages.

It may simply be that you have a constructive criticism about an article in ST Review, or that one or our columnists has inflamed you with his honesty. Whatever the reason, drop a line to me, Vic Lennard, at:

> Point Of View, Atari ST Review, Europa House, Adlington Park, Macclesfield SK10 4NP.

Please do not send stamped addressed envelopes; personal replies cannot be entered into. All mail received is considered for publication unless other wise stated and we reserve the right to edit letters where necessary without altering the context.

oreno. With Moc MogiC on the woy, this could be o good move.

For medium quolity direct-todisk recording, no other computer on the morket con motch the Falcon. Mojor products such os Cubase Audio ond Nototor Logic Audio will ensure this mochine's longevity ond give you domn good value for money.

As for incorrect odvert prices, the odvertisers supply us with the informotion – we just print it.

FLEET OF FOOT

I am writing to ST Review as a last hope. A few months ago I bought Fleet Street Publisher 3 from a dealer selling second-hand and obsolete software. It seems to be a pretty good package as far as DTP for the Atari goes. However, disk D is missing. This contains the graphics library and spelling checker, so it's not essential, but I'd really like to get hold of a copy. The dealer can't help, other than offering a refund and taking back the software, so I've made numerous 'phone calls to see if there are any piles of old Mirrorsoft software languishing on a dusty shelf somewhere. But no luck.

It seems to me that my only hope is to find somebody still using FSP3, and begging a copy of their disks. So if any ST Review contributors or readers have a copy, please contact me and put me out of my misery.

A. J. Osbourne, London

Guess whot? One of our freeloncers just hoppened to find his four-disk set of Fieet Street Publisher 3, ond so disk D is currently winging its woy to you. And we've also found o reoder with o copy of Autoroute for Mr. Edwords from lost issue...

IN THE FAMILY

In the October 1994 issue of ST Review, the columns written by Nial Grimes and Andrew Wright should be made required reading for all Atari enthusiasts. Andrew Wright's column about "keeping it in the family" should not be skipped over as buying from a "stack 'em high and sell 'em cheap" vendor can cost you dearly.

Having replaced my troublesome ST (complete with TOS 1.0 and external drive), with a brand new MegaSTe and 14" monitor, I was in Atari heaven. *Timeworks*, 1st Word Plus, Hyperchort and K-Spreod 4 all worked faster and better than ever before. The new version of TOS was great, and computing was a real pleasure.

Unfortunately my monitor was one of the early batch of the new Atari 14" beasts and the picture at the edges was less than perfect. Having had no problems in the past with my SM125 monitor I decided to return it to the supplier to be adjusted. This is when I discovered that this particular supplier was definitely not a "member of the family". After waiting the "stipulated" number of days for the monitor to be returned, I called the supplier. Guess what – the company had gone out of business and I had to make a claim through the Receiver. This was near the end of 1992 and the monitor was never returned. After using a 14" monitor, my SM125 just didn't seem the same.

A few weeks later, in November 1992, the MegaSTe began to chew disks. This time I called Atari who, after checking the registration number, agreed to rectify the problem free of charge if I sent it to them direct.

The local courier wasn't a member of the "Atari family" either. As the problems I was experiencing were intermittent, Atari indicated that I should be prepared to wait for a number of weeks for the problem to be identified and the machine to be returned to me. I contacted Atari at the end of one month – but they had never received my MegaSTe. The local courier office? "Oh yes we did." Atari? "Oh no we didn't"...

Atari finally won the day and confirmed the fact in writing. The courier came up with all sorts of reasons why it could not return my computer or replace it with a similar machine. After all, if I did not bother to let them know that it had not been delivered, it must be my fault!

I had to take my claim to court and accepted an out-of-court settlement in December 1993 that left me

slightly out of pocket. I just could not face more legal proceedings and accepted the moral victory even if it meant losing out financially. After over a year of fighting my

case, I was tired of all the hassle and relieved that my legal costs could be finalised.

Being unable to replace my MegaSTe with like for like I had to buy something – but what? After the support that Atari had given, I decided to purchase an STe from Ladbroke Computing, definitely one of "the family", and attached it to my old SM125. This was delivered on time as promised and I've had no problems. The money that I received at the end of the court case covered the cost of the STe and replaced my LC10 printer with a Canon BJ200. Brilliant printer – and very quiet.

I do miss the MegaSTe's faster processing speed, 4Mb of memory, hard drive and TOS version. In many ways, it is like having only half the computer that I had previously owned. But at least it has the Atari logo on it.

I don't regret sticking by Atari, a company that has always answered any queries promptly and courteously and hope to upgrade to a Falcon one day. The greater speed, higher drive capacity and superb screen display modes mean it is now the machine of my dreams.

Nial Grimes said that there are good reasons why you should stay with Atari – so think before you move on...

Charlie Hunter

I've printed your letter olmost in its entirety, Chorlie, os o worning to oll – ond it's nice to see our columnist's comments ringing true. Atori speciolists such os System Solutions, Lodbroke Computing and Gosteiner Technologies hove been oround for some yeors and ore unlikely to disappear in a puff of smake, genie-style. You may be able to buy computers cheaper from a non-Atori specialist, but is it really worth the risk?

If you hove to courier goods to o compony, contoct it first, osk it to organise the pick-up and then poy when the goods are picked up. That way, you're using a courier of known renown – and the company the other end knows exactly when to expect delivery.

And by the woy, the £25 cheque you'll receive shortly will poy the lion's shore of a TOS 2.06 upgrade for your STE from Compo Software...

The friendly database

From the makers of Harlekin comes Twist 2 - the new easy-to-use database for your Atari ST/STe/TT or Falcon030 computer. Twist's range of power features coupled with its uncluttered user interface make light of all manner of tasks ranging from building a card file database for your CD collection to implementing a comprehensive business database. Twist's features include:

- Full menus and keyboard shortcuts.
- Import and Export database files.
- · Wide variety of field types: calculated, required, text, integer, number, date, indexed, not editable, fixed and more.
- External clipboard support.
- Non-modal and flying dialogs/requesters.
- Easy-to-use reporting features.
- Relations (1:N and N:1) between fields.
